Subject: Wicklow

Dear Tara,

I have read through the Environmental report on the proposed Wicklow Dump site and I am of the conclusion that there is insufficient information contained within it to draw the conclusion that there will be no significant impact on the SAC Wicklow Reef.

In order to provide a fuller assessment, I recommend the applicants address the following issues:

- Sensitivity of habitat - their report contains no reference to the biogenic features and their sensitivity (e.g. see <http://www.marlin.ac.uk/speciessensitivity.php?speciesID=4277>). This analysis highlights that the species is tolerant to sedimentation and increasing suspended load in the water.
- Analysis of tidal streams and directions from chart, while applicable over western Irish Sea area, may not be applicable to the immediate vicinity of the spoil site - more detailed sediment dispersion/tidal analysis model may resolve this data deficiency.
- Stating that sediment is not likely to disperse outside the spoil site is highly unlikely given the fine nature of the material to be disposed and the strong tidal streams experienced at the site - this may be validated by sediment dispersion model.

I hope this is of some help in assessing the application?

All the best

Francis
