RE; Marco Salino and other's objection to Waste Licence
No. W0232-01 - Dublin City Council/Poolbeg
Incinerator Project at Pidgeon House Road Dublin 4.

Dear Sir/Madam,

I support this objection and I have something further to add to it re
PARTICULAR MATTER PM10 - PM0.1.

1. J.S.Owens demonstrated the existence of this ultrafine dust in ambient air by microscope examination and photography in the early 1920s while researching the London Smog Problem.
2. The some examination quantified the amounts present in the air.
3. The human body is not able to deal with this dust e.g. The cough/sneeze is an imperfect reaction with a high risk of driving particulate matter through the lung air membrane into the blood and no medical authority has any ideas on how to prevent this other than the non-production of such particular matter.

I suggest that E.P.A. provide funds to enable coroners to report on this matter, i.e. to conduct regular examination at a cellular level, because to do otherwise, now that it has been mentioned, would constitute a cover-up and a failure to maintain public confidence. Also veterinary sentinel post mortem results are similarly important. Toxicology too.

These are legitimate and practical considerations, which must be relevant to licensing and monitoring arrangements and must not be overlooked. E.P.A. needs to talk to H.S.E about public health monitoring arrangements and these talks must not be frustrated by a lack of baseline information.

Yours

JAMES ROUNTREE
