FACTUAL REPORT ON GROUND INVESTIGATION

1 INTRODUCTION

On the instructions and under the supervision of Kirk McClure Morton (the Engineer), acting on behalf of Donegal County Council (the Employer) a site investigation has been carried out by Foundation and Exploration Services Limited (FES) at Meenaboll Townlands, Co. Donegal on the site of a proposed landfill site.

The objective of the investigation was to determine the ground and groundwater conditions at the site and to provide information that would assist the Engineer in the geotechnical aspects of the design of the proposed works. The scope of the investigation was determined by the Engineer.

A factual report was requested including exploratory hole and field testing records, laboratory test results and site plan. The exploratory hole and laboratory test data have also been provided as digital data to AGS format. Photographs of the rock core and selected trial pits have been presented separately in Appendix D.

The site work, which comprised eight rotary open-hole boreholes and five rotary open hole and cored boreholes, to a maximum depth of 21.70 metres (Boreholes BH1 to BH13), twenty two trial pits, fifty mackintosh probes and a geophysical survey was carried out between the 27th January and 2nd March 2003. A second phase of geophysical testing was carried out in August 2003

Interpretative reports on both phases of the geophysical survey carried out by Minerex Environmental Limited are provided in Appendix F, the Phase 1 report outlines information relating to a similar adjacent site (Area B) on which intrusive works were not carried as part of these works.

2 THE SITE AND GEOLOGY

2.1 Site Location and Description

The site is located on open moorland adjacent to Meenaboll Hill in north central County Donegal.

The approximate National Grid reference of the site is 199 700 E and 409 100 N.

At the time of the investigation the site comprised open moorland formed through the recent felling of forestry. The site slopes gently from the south-east to the north-west from approximately 1260 metres to 220 metres above Mallin Head datum, and is generally uneven. The site is crossed by many small drainage channels. A central stream/channel runs south-east to south-west through the site. The area of investigation is approximately square (although tapered in the west corner) measuring approximately 500 metres across.

The site is bounded to the north-west by a track with areas of forest beyond. To the north-east and south-west are areas of recent felled forest, Meenaboll Hill lies to the south-east.

2.2 Geology

The site is known to be underlain by (blanket bog) peat deposits over Glacial Drift which in turn rests on pelites and psammites.

The Irish Geological Survey Report (Solid Geology) for North Donegal shows the south-eastern section of the site to be underlain by Pre-Cambrian age (Dalradian) pelites and

psammites of the Upper Falcarragh Formation. The north-eastern corner of the site is possibly underlain by the Seesiag-Clonmass Formation.

Further background research such as a desk study was not required within the terms of reference for the work.

3 PROPOSED DEVELOPMENT

It is proposed to construct a landfill site within a section of the area under investigation.

4 METHOD OF INVESTIGATION

4.1 General

Prior to drilling and excavation a Cable Avoidance Tool (CAT) survey was undertaken at each of the exploratory hole locations. Services were not encountered.

Details of the in-situ sampling and testing carried out, together with the descriptions of the strata encountered are given on the borehole and trial pit records. An explanation of the symbols and abbreviations used on all the exploratory hole records, together with the method of strata description utilised, is given in the General Notes on Exploratory Hole Records (KS/01 to 06). The investigation was generally carried out in accordance with BS 5930 : 1999[1]

All samples were transported to the laboratories and offices of FES in Consett for examination and testing as scheduled by the Engineer.

The work was supervised on a full time basis by an experienced Site Agent from Foundation and Exploration Services Limited. A Geotechnical Engineer returned to site to monitor groundwater levels and install inertia pumps and groundwater monitoring dataloggers.

4.2 Rotary Drilling

Five boreholes (BH1, BH2, BH3, BH6 and BH10) were sunk by rotary open hole techniques and continued by rotary coring techniques from rockhead to depths below ground level of between 9.70m (BH6) and 21.70m (BH1) using a Mercedes Unimog mounted Knebel 77 drilling rig. The coring was carried out using a double tube T6116 size core barrel, with semi-rigid coreliner, impregnated diamond bits and water flush. Upon completion of the coring the boreholes were reamed out to 200mm diameter to allow the installation of groundwater monitoring standpipes. Open hole drilling was carried out using a 200mm down the hole hammer system.

An additional eight boreholes (BH4, BH5, BH7, BH8, BH9, BH11, BH12 and BH13) were sunk by rotary open hole techniques only to depths below ground level of between 10.00m (BH7, BH9, BH11, BH12 and BH13) and 15.00m (BH4).

During the course of drilling attention was given to recording any evidence of water inflow in order that the groundwater level beneath the site could be established. Water levels at breaks in boring were recorded where appropriate.

[1] BS 5930 : 1999, Code of Practice for Site Investigation. British Standards Institution.

The cores were logged by an engineering geologist geotechnical engineer from FES and photographed on site. The Solid Core Recovery (SCR) and Rock Quality Designation (RQD) have been determined using the modified proposal, as given in Norbury et al[2], that a "solid cylinder" should be defined as having a full diameter (but not necessarily a full circumference) without discontinuities and should be measured axially along the core. In a number of instances the logging geologist assessed that some core from one run was recovered with the core from the next run. In these cases the TCR, SCR and RQD have been determined assuming that the core had been recovered from the core run in which it had first been drilled. The borehole records are given in Figures BH1 to BH13 and core photographs are given in Appendix D. Selected core samples were preserved in aluminium foil, cling film and wax and sent to the laboratory for testing.

4.3 Mackintosh Probeholes

Fifty mackintosh probeholes were sunk using a manually operated sliding hammer in order to assess the thickness of the peat deposits at the site. The records, including blows per 100mm penetration, are given in Figures FT2/1 to FT2/50 in Appendix B.

4.4 Trial Pits

Twenty two trial pits were excavated by machine using a track mounted 360 degree excavator to a maximum depth below ground level of 4.50m. The pits were logged by a geotechnical engineer from FES who took samples as shown on the trial pit records (Figures TP1 to TP22 in Appendix A). Notes on excavation stability and any groundwater encountered are also given on the records.

During the course of excavation attention was given to recording any evidence of water inflow in order that the groundwater level beneath the site could be established. The depth at which water seepage or ingress was encountered has been noted on the trial pit records.

4.5 Field Testing

Forty falling head permeability tests were carried out in a number of the boreholes during the course of drilling. The results are given in Figures FT3/1 to FT3/40 in Appendix B. The standing water levels used for calculating the results of the tests have been taken from either the water level during drilling, the water level at the end of the test or from readings of groundwater levels in the standpipes, they may therefore, not reflect the true standing water level of the groundwater in the test section or strata being tested. Caution should be exercised when using these test results to derive parameters for design purposes. Such tests in boreholes test only a small volume of soil or rock and may be subject to disturbance or smear along the side of the borehole. Falling head tests are also very prone to silting up. The permeability value of the soil mass as a whole may be significantly different from the values derived from these tests.

A single packer permeability test was undertaken in Borehole BH2, the result is given in Figure FT4/1.

---

[2] Norbury, D.R., Child, G.H., and Spink, T.W., 'A critical review of Sections 8 (BS 5930 : 1981), Soil and rock descriptions, Geological Society Engineering Geology Special Publication No 2, Proceedings of 20th Regional Meeting of the Engineering Group, Guildford, 1986.

4.6 Instrumentation

On completion of drilling, a slotted 100mm standpipe was installed in each of the boreholes.

Details of the installations are given on the relevant borehole records.

Observations of the water level in the standpipes were made both during and after the fieldwork period. The results are given on Figures FT1/1 to FT1/13 in Appendix B.

A geotechnical engineer from FES returned to site and installed within each standpipe a dedicated inertia pump and a Solinst MT10 pressure/temperature datalogger to record total water pressures and temperatures within the standpipes. A barometric pressure gauge was also installed at the site in order that the pressure readings within the standpipes may be adjusted for variations in atmospheric pressure. Details of the dataloggers installed and the depth of installation are given in Appendix B.

4.7 Survey

The ground levels at, and grid co-ordinates of, the exploratory hole positions were determined using a GPS System and related Mallin Head Datum and Irish National Grid co-ordinates respectively. The ground levels have been quoted to the nearest 0.05 m on the exploratory hole records and to the nearest 0.01 m on the Water Level Readings sheets. Grid co-ordinates are quoted to the nearest 1.00m on the exploratory hole records.

The positions of the exploratory holes were set out by reference to the site grid produced for the geophysical survey works.

5 RESULTS OF EXPLORATORY HOLES

5.1 General

Borehole records (Figures BH1 to BH13) and trial pit records (Figures TP1 to TP22) giving details of the strata encountered are provided later in the report. A site plan showing the approximate positions of the exploratory holes is presented in Figure SP1 in Appendix E.

The strata descriptions given in the borehole records, unless otherwise noted, are compiled from an examination of the disturbed samples only, together with the results of any field and laboratory testing. Relative density descriptions are based on the results of the SPT and have not been amended to take into account any overburden effects. The consistency of cohesive strata is based on visual assessment only. Where there is a degree of uncertainty regarding the relative density or consistency of the soil, the terms "probably" or "possibly" have been used and the descriptions should be treated with caution.

Any interpolation or extrapolation of strata from exploratory holes is an estimate only of the likely stratification and is subject to the interpretation of the reader. The records should be read in conjunction with the General Notes on Exploratory Hole Records. ***Particular attention is drawn to the comments made on groundwater and interpretation which are given in these Notes.*** There may be ground conditions at the site which have not been revealed by the investigation.

5.2 Strata Encountered

Excluding the Made Ground used to construct access roads, the boreholes and trial pits encountered the following general succession of strata:

Recent PEAT (present across the site and proved to depth locally of approximately 5 metres, but locally removed at some borehole locations to provide access).

GLACIAL DRIFT (proved to vary in thickness from 0.5 metres to 5.8 metres).

DALRADIAN PSAMMITES/SCHISTS

Aside the Made Ground, this concurs with the succession anticipated from published geological records.

5.3 Groundwater

Groundwater was encountered during drilling in all the boreholes and selected trial pits. Details of the individual groundwater strikes can be found on the relevant exploratory hole records.

Readings of groundwater levels in the standpipe piezometers are given in Figures FT1/1 to FT1/13 in Appendix B.

6 GEOTECHNICAL LABORATORY TESTING

6.1 Introduction

The following laboratory tests were scheduled by the Engineer and carried out by /or for FES in accordance with BS1377:1990 "Methods of test for Soils for civil engineering purposes" where applicable. The results are given in tabular and/or graphical form as appropriate in a later section of the report. ***Attention is drawn to the comments on interpretation of the results of the investigation on Sheet 1 of the General Notes on Exploratory Hole Records.*** Notes and keysheets also precede the laboratory test results.

All tests with the exception of selected rock testing and the chemical analyses were carried out in the Consett laboratory of FES and the tests for which the laboratory have UKAS accreditation are detailed on the Schedules preceding the laboratory test results in Appendix C.

The chemical analyses were undertaken by City Analytical Services Limited, whose laboratory is accredited for the tests undertaken.

Selected rock core testing was carried out in the laboratory of Fugro (Scotland) Limited, whose laboratory is accredited for the tests undertaken.

6.2 Index Properties

Liquid and plastic limit and natural moisture content determinations were made on sixteen samples of the cohesive soils in order to classify the plasticity and shrinkability of the materials and the results are given on the Summary of Classification Tests (Figures LT1/1 to LT1/3 in Appendix C).

6.3 Particle Size Analyses

Particle size analyses were undertaken on a total of six samples by sieving and sedimentation in order to classify the materials in respect to their grain size. The results are given as particle size distribution curves (Figures LT2/1 to LT2/6 in Appendix C).

6.4 Compaction Related

The moisture content and dry density relationship was determined in the standard one litre mould for three samples using the 2.5 kg compactive effort as specified. The results are given in Figures LT3/1 to LT3/3 in Appendix C.

The California Bearing Ratio (CBR) value was determined for two samples recompacted using the 2.5 kg compactive effort. The tests were carried out unsoaked and without surcharge. The results are given in Figures LT3/4 and LT3/5 in Appendix C.

6.5 Rock Tests

The point load index using the methods outlined by the ISRM Commission on Testing Methods, 1985, was determined for ten samples of rock core. The results are given in Figure LT8/4 in Appendix C.

The Unconfined Compressive Strength (UCS) four samples of rock core was determined using the method outlined in ISRM Suggested Methods - Rock Characterization, Testing and Monitoring - Editor E.T Brown, 1981. The results are given in Figure LT8/3.

The moisture contents and porosities of four samples of rock core were determined and the results are given on the Summary of Rock Classification Tests in Figure LT8/1.

The Brazilian Test Strength of four samples of rock core were determined by Fugro (Scotland) Limited and the results are given in Appendix C. In addition Fugro (Scotland) Limited also determined cation exchange value and magnesium soundness of four samples of rock core.

The Slate Durability properties of four samples were determined and the results are given in Figure LT8/2.

6.6 Chemical Analyses

Chemical analyses have been made on fourteen samples of soil. Five specimens were tested for their organic content, nine samples for their cation exchange capacity, six for their carbonate content and four specimens for total acid soluble sulphate content and pH value.

These tests were undertaken by City Analytical Services and the results are presented as their test certificates reference FESB 74332 and FES/75604 at the end of Appendix C.

EXPLORATORY HOLE RECORDS

Notes on Limitations	Figure A
General Notes and Key Sheets on Exploratory Hole Records	Figures KS/01 to KS/06
Borehole Records	Figures BH1 to BH13
Trial Pit Records	Figures TP1 to TP22

GENERAL NOTES

1 OPERATING PROCEDURES

The procedure used for cable percussion boring, rotary drilling, trial pitting, sampling, in-situ and laboratory testing and sample descriptions are generally in accordance with BS5930:1999 'Code of practice for Site investigations', and BS1377:1990 'Methods of test for Soils for civil engineering purposes', unless stated otherwise.

2 GROUNDWATER

Exploratory hole water levels are recorded together with the depths at which seepages or inflows of water are detected. These observations are noted on the Records, but may be misleading for the following reasons:

a) The exploratory hole is rarely left open at the relevant depth for a sufficient time for the water level to reach equilibrium.

b) A permeable stratum may have been sealed off by the borehole casing.

c) Water may have been added to the borehole to facilitate progress.

d) The permeability may have been altered by the excavation/boring/drilling process.

Standpipes or piezometers should be installed when an accurate record of groundwater level is required, however, it should be noted that groundwater levels may vary significantly due to seasonal, climatic or man-made effects. Water levels recorded during the investigation and any advice or comment made accordingly may, therefore, not be appropriate to particular foundation, geotechnical design, or temporary works solutions. Long term monitoring of standpipes or piezometers is always recommended when water levels are likely to have a significant effect on design.

3 CHISELLING

The remarks in the Borehole Records contain information on the time spent advancing the borehole by 'Chiselling Techniques', and the depth of borehole over which it was required. Such information may be affected by a wide range of variable factors, unrelated to the geotechnical properties of the strata. Such factors include, but are not restricted to: plant, equipment and operator. The data should, therefore, only be used subjectively and with extreme caution.

4 IDENTIFICATION AND DESCRIPTION OF SOILS - SEE ALSO SHEET 3

The identification system follows the Company's Manual of Standing Instructions for Logging procedures which is based on Tables 12 and 13, BS 5930: 1999.

Relative density terms are given where supported by SPT N-values, with the exception of made ground. The fiels assessment of compactness or relative density for coarse grained soils is only given on trial pit records where visual inspection of the soils has been undertaken. Where the terms 'soft to firm', 'firm to stiff' etc. are used they indicate a strength based on inspection (and not supported by laboratory and in-situ testing) which is close to the borderline between the two terms and cannot be precisely defined by inspection only. Visual assessments of consistency may have been amended in the light of field or laboratory test results.

Where 'to' links two terms, as in 'slightly sandy to sandy' this again represents a borderline case, where the precise proportion of constituents cannot be determined by inspection only.

The name of the geological formation is only given where this can be determined with confidence (see Section 41.5 of BS 5930: 1999).

5 INTERPRETATION OF THE RESULTS OF THE INVESTIGATION

The description of ground conditions encountered and any engineering interpretation included in the report are based on the results of the boreholes and trial pits and the field and laboratory testing carried out. There may be ground conditions at the site which have not been revealed by the investigation and consequently have not been taken into account.

Any interpolation or extrapolation of strata between exploratory holes shown on any cross-sections or site plans is an estimate only of the likely stratification based on general experience of the ground conditions and is subject to the interpretation of the reader.

The term "TOPSOIL" is used in this report to describe the surface, usually organic rich, layer including turf, subsoil and weathered material with roots. The use of this term may not imply that the soil satisfies the requirements of Clause 3 of BS 3882 (1994), "Recommendations and Classification of Topsoil", or is suitable for general horticultural and agricultural purposes.

Laboratory test results in this report give the soil properties of individual specimens tested under specified conditions. Individual results or groups of results may not be appropriate for use as design parameters for some geotechnical analyses. The samples may be non-representative, disturbed internally, or prepared and tested under conditions suited for different geotechnical applications. Unless the selection of design parameters is discussed in this report, it is recommended that the advice of a Geotechnical Specialist is sought.

IN-SITU TESTING AND SAMPLING

STANDARD PENETRATION TESTS

S( ) Standard Penetration Test (SPT). A 50 mm diameter split barrel sampler is driven 450 mm into the soil using a 63.6 kg hammer with a 760 mm drop. The penetration resistance (also known as the 'N' value) is expressed as the number of blows required to obtain 300 mm penetration below an initial seating drive of 150 mm which is taken through any ground which may be disturbed at the base of the borehole. The test is usually completed when the number of blows recorded during the test drive only reaches 50 in soils or 100 in weak rock. If a sample is not recovered in the sampler, a disturbed sample is taken on completion of the test and given the same depth as the top of the Standard Penetration Test drive.

C( ) Standard Penetration Test carried out with a 60E cone. The test is usually conducted in coarse granular soils or weak rock using the same procedure as for the SPT, but with a 50 mm diameter, 60E apex, solid cone fitted to the split barrel. A bulk disturbed sample is taken and given the same depth as the top of the test drive.

The depth on the borehole record at the left hand side of the 'depth' column is that at the start of the normal 450 mm penetration. Where the full penetration of 300 mm for the test drive is obtained, the penetration resistance ('N' value) is reported in the 'SPT Blows/N' column. If the full penetration of 300 mm in the test drive is not obtained, then the length of drive (test length in mm) and the penetration resistance (number of blows) are both reported. Blows through the initial seating drive (normally 150 mm) are not reported.

* in the 'Test Length' column denotes that the blows and penetration were all in the initial Seating Drive section.

OTHER IN-SITU TESTS

The following in-situ tests are reported on the **Borehole Records**, in the 'Test Length' and 'SPT Blows' columns where appropriate.

k In-Situ Permeability Test - refer to detailed test results for permeability values.

PMT Pressuremeter Test - refer to detailed test results for modulus values, etc.

VN/R( ) Borehole Shear Vane Test (Undrained Shear strength - c_u - in kPa) - refer also to detailed test results, N - 'Natural' or peak shear strength, R - Remoulded shear strength

The following in-situ tests are reported on **Trial Pit** and/or **Window Sample Records** in the 'Type' and 'Result' columns, where appropriate.

VN/R( ) Hand Shear Vane Test (Direct reading of Undrained Shear strength in kPa), N - Natural or Peak, R - Remoulded

PP( ) Pocket Penetrometer (Penetration resistance reported in kg/cm^2 or as equivalent c_u in kPa)

MX ( ) Mexecone Reading given as equivalent CBR% value to the nearest 0.5% at 75 mm intervals

CBR( ) California Bearing Ratio Test (CBR%) - refer also to detailed test results

PID( ) Photo-Ionisation Detector Readings in headspace of small disturbed chemical samples. Result given in ppm by volume.

SOIL SAMPLES

U General purpose open tube sample. Sample normally taken with open tube sampler approximately 0.1 m diameter and 0.45 m long and driven with 80 kg sinker bar and 56 kg sliding hammer, unless noted otherwise. "XX" in U100 blows column denotes the number of hammer blows. The height of hammer drop can be variable depending on operator technique. Depths are given to the top of the sample if full penetration and recovery are achieved, otherwise actual lengths of penetration and recovery are given in the appropriate columns.

U(X) General purpose open tube sample (X) mm diameter

TW(X) Thin wall (push) sample (X) mm diameter

P(X) Piston sample (X) mm diameter

CBR Sample taken in CBR Mould

D Small disturbed sample (jar with air tight lid)

B Bulk disturbed sample (polythene bag, tied at neck - size dependent on purpose)

W Water sample

Sample not recovered

CD Sample for chemical analysis in a plastic tub

K Sample for chemical analysis in an amber glass jar

VL Sample for chemical analysis in a glass vial

FOUNDATION & EXPLORATORY SERVICES	NOTES ON EXPLORATORY HOLE RECORDS	Contract No E02755
		Figure No KS0/02

KEY TO BOREHOLE AND TRIAL PIT RECORDS

Identification and Description of Soils

	Basic Soil Type	Particle Size (mm)	Visual Identification	Particle Nature and Plasticity
VERY COARSE SOILS	BOULDERS	200	Only seen complete in pits or exposures.	Particle shape Angular Subangular Subrounded Rounded Flat Elongate Texture Rough Smooth Polished
	COBBLES	60	Often difficult to recover from boreholes.	
COARSE SOILS (Typically over 65% Sand and Gravel Sizes)	GRAVEL	coarse 20 medium fine 6	Easily visible to naked eye; particle shape can be described, grading can be described. Well graded: wide range of grain sizes, well distributed. Poorly graded: not well graded. (May be uniform: size of most particles lies between narrow limits; or gap graded; an intermediate size of particle is markedly under represented).	
	SAND	2 coarse 0.6 medium 0.2 fine	Visible to naked eye; no cohesion when dry; grading can be described. Well graded: wide range of grain sizes, well distributed. Poorly graded: not well graded. (May be uniform: size of most particles lies between narrow limits; or gap graded; an intermediate size of particle is markedly under represented).	
FINE SOILS (Typically over 35% Silt and Clay)	SILT	0.06 coarse 0.02 medium 0.006 fine	Only coarse silt visible with hand lens; exhibits little plasticity and marked dilatancy; slightly granular or silky to the touch. Disintegrates in water; lumps dry quickly; possesses cohesion but can be powdered easily between fingers.	
	CLAY/SILT	0.002	Intermediate behaviour between clay and silt. Slightly dilatant	
	CLAY		Dry lumps can be broken but not powdered between the fingers; they also disintegrate under water but more slowly than silt; smooth to the touch; exhibits plasticity but no dilatancy; sticks to the fingers and dries slowly; shrinks appreciably on drying usually showing cracks. Intermediate and high plasticity clays show these properties to a moderate and high degree, respectively.	
ORGANIC SOILS	ORGANIC CLAY, SILT or SAND	Varies	Contains varying amounts of organic vegetable matter - defined by colour: grey - slightly organic; dark grey - organic; black - very organic.	EXAMPLES OF COMPOSITE TYPES (indicating preferred order for description)
	PEAT	Varies	Predominantly plant remains usually dark brown or black in colour, often with distinctive smell; low bulk density. Can contain disseminated or discrete mineral soils.	Loose brown very sandy subangular coarse GRAVEL with many pockets (<5 mm across) of soft grey clay. Firm brown thinly interlaminated SILT and CLAY. Dense light brown clayey fine and medium SAND.

Composite Soil Types (Mixtures of basic soil types)

Scale of secondary constituents with coarse and very coarse soils. Term either before or after constituent.

Term before	Principal	Term after	Approx % Secondary
Slightly (sandy*)	SAND, GRAVEL, COBBLES or BOULDERS	Used to describe components of secondary constituents. e.g. Gravel is medium subangular fine sandstone and mudstone.	<5
--(sandy*)			5 to 20†
Very (sandy*)			20† to 40†
--		and (sand*) or and (cobbles+)	50†

* Fine or coarse soil type as appropriate
\+ Very coarse soil type as appropriate
† or described as fine soil depending on mass behaviour

Scale of secondary constituents with fine soils. Terms either before or after principal constituent.

Term before	Principal	Term after	Approx % Secondary
Slightly (sandy*)	CLAY or SILT	Used to describe components of secondary constituents. e.g. gravelly sandy CLAY. Gravel is coarse rounded quartzite fragments.	<35
-- (sandy*)			35 to 65
Very (sandy*)			>65†

* Coarse soil type as appropriate
† or described as coarse soil depending on mass behaviour

Compactness/Strength

Term	Field Test
Loose	By inspection of voids and particle packing
Dense	

Standard Penetration Test in Borehole

No of blows	Relative Density
<4	Very Loose
4-10	Loose
10-30	Medium Dense
30-50	Dense
>50	Very Dense

Slightly cemented	Visual Examination: pick removes soil in lumps which can be abraded.	
Un-compact	Easily moulded or crushed in the fingers	
Compact	Can be moulded or crushed by strong pressure in the fingers	
Very soft	Finger easily pushed in up to 25 mm	c_u (kPa) <20
Soft	Finger pushed in up to 10 mm	20 to 40
Firm	Thumb makes impression easily	40 to 75
Stiff	Can be indented slightly by thumb	75 to 150
Very Stiff	Can be indented by thumbnail	150 to 300
Hard	Can be scratched by thumb nail	>300
Firm	Fibres already compressed together	
Spongy	Very compressible and open structure	
Plastic	Can be moulded in hand and smears fingers	

Structure

Term	Field Identification
Homogeneous	Deposit consists essentially of one type.
Inter-bedded or inter-laminated	Alternating layers of varying types. Pre-qualified by thickness term if in equal pro-portions. Other-wise thickness of and spacing between subordinate layers defined.
Hetero-geneous	A mixture of types.
Weathered	Particles may be weakened and may show concentric layering.
Fissured	Breaks into blocks along unpolished discontinuities.
Sheared	Breaks into blocks along polished discontinuities
Intact	No fissures.
Homogeneous	Deposit consists essentially of one type.
Inter-bedded or Inter-laminated	As described for coarse soils above.
Weathered	Usually has crumb or columnar structure.
Fibrous	Plant remains recognisable and retain some strength.
Pseudo-fibrous	Plant remains recognisable, strength lost.
Amorphous	Recognisable plant remains absent.

Interval Scales

Scale of Bedding Spacing

Term	Mean Spacing mm
Very thickly bedded	over 2000
Thickly bedded	2000-600
Medium bedded	600-200
Thinly bedded	200-60
Very thinly bedded	60-20
Thickly laminated	20-6
Thinly laminated	under 6

Spacing terms may also be used for distance between partings, isolated beds or laminae, desiccation cracks, rootlets etc.

Scale of spacing of other discontinuities

Term	Mean spacing mm
Very widely spaced	over 2000
Widely spaced	2000-600
Medium spaced	600-200
Closely spaced	200-60
Very closely spaced	60-20
Extremely closely spaced	under 20

FOUNDATION & EXPLORATION SERVICES	NOTES ON EXPLORATORY HOLE RECORDS	Contract No E02755 Figure No KS0/04

ROCK CORES

DESCRIPTIVE ORDER

Strength, Structure, Colour, Texture, Grain Size, ROCK NAME, minor constituents and additional information, (geological formation - see comments under identification and description of soils), factual description of weathering state (if appropriate) and description of weathering state and discontinuities (if appropriate)

STRENGTH

Term	Field identification	Compressive Strength (MPa)
Very weak	Gravel sized lumps may be crushed between finger and thumb	<1.25
Weak	Gravel sized lumps can be broken in half under heavy hand pressure.	1.25 - 5.0
Moderately weak	Only thin slabs corners or edges can be broken off with heavy hand pressure.	5.0 - 12.5
Moderately strong	When held in hand rock can be broken by hammer blows.	12.5 - 50
Strong	When resting on a solid surface rock can be broken by hammer blows.	50 - 100
Very strong	Rock chipped by heavy hammer blows	100 - 200
Extremely strong	Rock rings on hammer blow. Only broken by sledge hammer	>200

DISCONTINUITIES

Bedding Spacing & Planar Structures*	Spacing (mm)	Discontinuity Spacing
	>6000	Extremely widely spaced
Very thickly bedded	>2000 2000-6000	Very widely spaced
Thickly bedded	600 - 2000	Widely spaced
Medium bedded	200 - 600	Medium spaced
Thinly bedded	60 - 200	Closely spaced
Very thinly bedded	20 - 60	Very closely spaced
Thickly laminated (Sedimentary) Very narrow (Metamorphic & Igneous)	6 - 20	Extremely closely spaced
Thinly laminated (Sedimentary) Very narrow (Metamorphic & Igneous)	<6	Extremely closely spaced

* For igneous and metamorphic rocks the appropriate descriptive term for planar structure should be used e.g. medium foliated gneiss, very narrowly cleaved slate, very thickly flow banded diorite.

WEATHERING

BS5930 : 1999 requires that standard descriptions of weathered rocks for engineering purposes should always include comments on the degree, extent and nature of any weathering effects at material or mass scales. This may allow subsequent classification and provide information for separating rock into zones of like character. Indications of weathering include

- changes in colour
- changes in fracture state
- reduction in strength
- presence, character and extent of weathering products

If a systematic classification following the guidelines given in BS 5930 : 1999 can be applied unambiguously, this is described in the text of the report. Otherwise, the rocks are not classified in terms of weathering beyond the approach described above.

ROCK CORES

ROCK CORE SIZES

The core barrels commonly used by the Company in site investigations are as follows:

Core Barrel Type	Borehole Diameter (mm)	Standard Core Size (mm)	Core Size using Rigid Plastic Liner (mm)	Casing Size or Type	Casing O.D (mm)	Casing I.D (mm)
BRITISH STANDARD SIZES (BS 4019,1966)						
NWM	75.7	54.7	51	NX	88.9	76.2
HWF	98.8	76.2	72	HX	114.3	100.0
HWAF	99.5	70.9	-	HX	114.3	100.0
PWF	120.0	92.1	87	PX	139.7	122.3
SWF	145.4	112.8	107	SX	168.3	147.7
UWF	173.7	139.8	132	UX	193.7	176.2
WIRELINE SIZES						
BQ	59.9	36.4	35			
NQ	75.7	47.6	45			
HQ	96.1	63.5	61			
PQ	122.7	85.0	82			
GEOBORE S	146.0	102.0	102	SX	168.3	147.7

T2 66	66.1	51.9	-	74	74.3	67.3
T2 76	76.1	61.9	-	84	84.3	77.3
T2 86	86.1	71.9	68	98	98.0	89.0
T2 101	101.1	83.9	80	113	113.0	104.0
T6 116	116.1	92.9	89	128	128.0	118.0
T6 131	131.1	107.9	104	143	143.0	133.3
NON STANDARD BARRELS						
4.12F TRIEFUS	105.2	74.7	72	PX	139.7	122.3
5.5x4C SINGLE TUBE	139.7	101.6	-	SX	168.3	147.7
B116	116	102	-	PX	139.7	122.3
B146	146	132	-	SX	168.3	147.7

Note: Core diameters may vary when different lining systems are in use.

ROCK CORE CHARACTERISTICS

TCR **Total Core Recovery.** The length of the total amount of core sample recovered, expressed as a percentage of the length of the core run.

SCR **Solid Core Recovery.** The length of solid core recovered, expressed as a percentage of the length of the core run.

Solid core is defined as that length of core which has a full diameter, but not necessarily a full circumference. Only natural fractures are considered. Drilling or handling induced fractures are ignored.

RQD **Rock Quality Designation.** The length of solid core recovered in pieces each more than 100 mm long as a percentage of the core run length.

I_f **Fracture Index.** The number of discontinuities expressed as 'fractures per metre', measured over any convenient length of consistent fracture characteristics.

Zones of atypical fracturing of restricted extent which occur within a rock unit of uniform fracture characteristics are identified within the Description of Strata.

NI - Not Intact NR - No Recovery NA - Not Applicable

I_s Corrected **point load strength index** $I_s(50)$ which is given in MPa.

		(0)	3.50	5.00										(2.80)		

Remarks (See notes & keysheets)

1. Groundwater was measured during permeability testing at between 0.12m and 0.70mbgl.
2. Prior to boring a Cable Avoidance Tool (CAT) survey was carried out.
3. RQD & SCR based upon assuming where possible the many parallel and cross cutting irregular fractures are drilling induced along lines of weakening within rock mass.
4. Variable head permeability testing carried out at 1.50m, 6.85m and 12.65mbgl.
5. Rotary open hole drilling was advanced using a 200mm down the hole hammer, coring using T6116 bits. Borehole reamed to depth to accommodate installation.

														3.20	233.95	
		(90)	3.20	3.60									Dark grey weathered SCHIST (Driller's description).	(0.40)		
			3.50		D	4								3.60	233.55	
		(90)	3.60	4.15	67		0		0				Grey slightly weathered fine grained PSAMMITE, strong locally interlaminated (5mm scale) with dark grey pelite moderately weak. Occasional bands/lenses (<20mm) of quartzite. Foliation weakly developed at 40 degrees on 1mm to 15mm scale. Between 3.60m and 6.00m; possible medium to closely spaced foliation inclined (40 degrees), planar to slightly irregular and clean locally possibly slightly polished. Rough drilling induced fractures along lines of weakness and subvertical anastomised partially quartz healed (<2mm) fractures. Stained non-drilling induces fractures are described individually. Between 3.60m and 3.73m; tight, planar, subvertical (80 degrees) rough iron stained fracture. Between 3.60m and 3.73m; vertical, irregular, possibly tight to open, rough, iron stained fracture.			
		(90)	4.15	4.95	100	48			29			4		(2.40)		

Remarks (See notes & keysheets)

1. Groundwater was encountered at 1.00m during drilling and rose to 0.70m after 20 mins.
2. Prior to excavation a Cable Avoidance Tool (CAT) survey was carried out.
3. A variable head permeability test was carried out at 2.50m, 3.60m and 11.80m.
4. Approximately 1.50m of peat and 0.10m of Glacial Till removed to gain access.
5. The borehole was advanced by open hole means by 200mm using a hammer and then progressed by rotary coring means.
6. RQD x SCR based upon assuming many schistocity parallel fractures and subvertical fractures are drilling induced.
7. Core runs 5 and 6 adjusted.

Test Details
(All water depths measured below Datum)

Depth of Test Section		5.00 to 5.00	m
Casing Depth		5.00	m
Borehole Depth		5.00	m
Datum (mbgl, -ve means above gl)		-0.50	m
Depth to Standing Water Level (d1)		2.11	m
Depth to Water: Start of Test (d0)		0.02	m
End of Test		0.08	m
Test Type		Falling	
Response Zone Length	(L) =	0.00	m
Borehole diameter in test section	(D) =	0.165	m
Cross sectional area of borehole	(A) =	0.02138	m²
Intake Factor (BS 5930 pg50, figure b)	(F) =	0.45	
General Time Lag Factors (H1) = 2.06	(t1) =	300	sec
(H2) = 2.05	(t2) =	1200	sec

Coefficient of Permeability using General Time Lag Approach

$$k = \frac{A}{F(t2-t1)} \log_e \frac{H1}{H2} = 2.5 \times 10^{-7} \text{ m/s}$$

Remarks

Water level in standpipe at 1.61m bgl 25/02/03

Standing water level assumed as level recorded in standpipe for calculation purposes. Calculation based on earlier data only

(All water depths measured below Datum)

Depth of Test Section		3.60 to 10.15	m
Casing Depth		3.60	m
Borehole Depth		10.15	m
Datum (mbgl, -ve means above gl)		-0.30	m
Depth to Standing Water Level (d1)		0.18	m
Depth to Water: Start of Test (d0)		0.02	m
End of Test		0.17	m
Test Type		Falling	
Response Zone Length	(L) =	6.55	m
Borehole diameter in test section	(D) =	0.116	m
Cross sectional area of borehole	(A) =	0.01057	m²
Intake Factor (BS 5930 pg50, figure d)	(F) =	8.71	
Basic Time Lag Factor	(T) =	210	sec

Coefficient of Permeability using Basic Time Lag Approach

$$k = \frac{A}{FT} = 5.8 \times 10^{-6} \text{ m/s}$$

Remarks

End Test depth assumed as rest water level for calculation purposes only.

Test Details
(All water depths measured below Datum)

Depth of Test Section		2.70 to 10.00	m
Casing Depth		2.70	m
Borehole Depth		10.00	m
Datum (mbgl, -ve means above gl)		-0.45	m
Depth to Standing Water Level (d1)		1.23	m
Depth to Water: Start of Test (d0)		0.08	m
End of Test		1.22	m
Test Type		Falling	
Response Zone Length	(L) =	7.30	m
Borehole diameter in test section	(D) =	0.2	m
Cross sectional area of borehole	(A) =	0.03142	m^2
Intake Factor (BS 5930 pg50, figure d)	(F) =	10.69	
Basic Time Lag Factor	(T) =	200	sec

Coefficient of Permeability using Basic Time Lag Approach

$$k = \frac{A}{F\,T} = 1.5 \times 10^{-5}\ m/s$$

Remarks
End Test depth assumed as rest water level for calculation purposes only.

GEOTECHNICAL LABORATORY TEST RESULTS

Geotechnical Testing Schedules of UKAS Accreditation	
General Notes on Laboratory Test Results	Figures LKS/01 to LKS/02
Summary of Classification Tests	Figures LT1/1 to LT1/3
Particle Size Distribution Curves	Figures LT2/1 to LT2/46
Compaction Related Test Results	Figures LT3/1 to LT3/5
Rock Test Results	Figures LT8/1 to LT8/4
Rock Test Results – Carried out by Fugro	
Results of Chemical Analyses	

GENERAL NOTES ON LABORATORY TEST RESULTS

1. TEST METHODS

The tests reported on the following sheets have been carried out in accordance with the methods given in BS 1377 : 1990 'Methods of test for Soils for civil engineering purposes, subject to a small number of variances as described below under the respective headings. These notes also serve as keysheets to any notation used in reporting the laboratory tests.

2. KEY TO NOTATION OF SAMPLE TYPE

D: Disturbed sample.

B: Bulk disturbed sample.

U: General purpose open drive tube sample.

P: Piston sample.

TW: Thin wall sample.

RC: Rotary core sample.

3. CLASSIFICATION TESTS

% passing 425µm: this figure is only correctly reported when 'WS' is shown in the 'Method' of preparation column. For 'HP' and 'AR', the reported figure is an estimate only.

WS: sample prepared by Wet Sieving.

HP: sample prepared by Hand Picking (removal) of gravel sized fragments.

AR: sample tested As Received.

NP: non-plastic.

4. COMPACTION RELATED TESTS

Sample preparation : **Individual** indicates test carried out on individual sub-samples.

Single indicates test carried out on a single sample.

Assumed values of particle density are reported in brackets e.g. (2.67)

5. SAMPLE DESCRIPTIONS

The sample descriptions shown on the test report sheets are the technician's visual descriptions of the test samples, in accordance with Clause 9.1 of Part 1 of BS 1377 : 1990 and do not necessarily comply with the requirements of BS 5930 : 1983. For a more comprehensive description of the soil samples to BS 5930, reference should be made to the exploratory hole records, or an engineering description can be provided on request.

6. INTERPRETATION OF TEST RESULTS

Laboratory test results in this report give the soil properties of individual specimens tested under specified conditions. Individual results or groups of results may not be appropriate for use as design parameters for some geotechnical analyses. The samples may be non-representative, disturbed internally, or prepared and tested under conditions suited for different geotechnical applications. Unless the selection of design parameters is discussed in this report, it is recommended that the advice of an appropriately qualified and experienced specialist is sought.

SCHEDULE OF UKAS ACCREDITED LABORATORY TESTS FOR SOILS FOR CIVIL ENGINEERING PURPOSES

Types of Test/Properties Measured Range of Measurement		Standard Specification Equipment/Techniques Used
Physical Tests	Moisture content - oven drying method	BS 1377: Part 2: 1990
	Saturation moisture content of chalk	BS 1377: Part 2: 1990
	Liquid limit - cone penetrometer	BS 1377: Part 2: 1990
	Liquid limit - cone penetrometer - one point method	BS 1377: Part 2: 1990
	Plastic limit	BS 1377: Part 2: 1990
	Plasticity index and liquidity index	BS 1377: Part 2: 1990
	Density - linear measurement	BS 1377: Part 2: 1990
	Density - immersion in water	BS 1377: Part 2: 1990
	Density - water displacement	BS 1377: Part 2: 1990
	Particle density - gas jar	BS 1377: Part 2: 1990
	Particle size distribution - wet sieving	BS 1377: Part 2: 1990
	Particle size distribution - dry sieving	BS 1377: Part 2: 1990
	Particle size distribution - sedimentation - pipette method	BS 1377: Part 2: 1990
	Dry density/moisture content relationship (2.5kg rammer)	BS 1377: Part 4: 1990
	Dry density/moisture content relationship (4.5kg rammer)	BS 1377: Part 4: 1990
	Dry density/moisture content relationship (vibrating hammer)	BS 1377: Part 4: 1990
	Moisture condition value (MCV)	BS 1377: Part 4: 1990
	Chalk crushing value	BS 1377: Part 4: 1990
	One-dimensional consolidation properties	BS 1377: Part 5: 1990
Mechanical Tests	California Bearing Ratio (CBR) (loads from 0.2 to 25kN)	BS 1377: Part 4: 1990
	Unconfined compressive strength - load frame method (loads from 0.2 to 25kN)	BS 1377: Part 7: 1990
	Undrained shear strength - triaxial compression without measurement of pore pressure (loads from 0.2 to 25kN)	BS 1377: Part 7: 1990
	Undrained shear strength - triaxial compression with multistage loading and without measurement of pore pressure (loads from 0.2 to 25kN)	BS 1377: Part 7: 1990

SCHEDULE OF UKAS ACCREDITED LABORATORY TESTS FOR ROCKS

Types of Test/Properties Measured Range of Measurement		Standard Specification Equipment/Techniques Used
Physical Tests	Water Content	ISRM Suggested Methods – Rock Characterization Testing and Monitoring. Ed. E T Brown - 1981
	Porosity and density - by saturation and calliper techniques	ISRM Suggested Methods – Rock Characterization Testing and Monitoring. Ed. E T Brown - 1981
	Porosity and density - by saturation and buoyancy techniques	ISRM Suggested Methods – Rock Characterization Testing and Monitoring. Ed. E T Brown - 1981
	Slake-durability index	ISRM Suggested Methods – Rock Characterization Testing and Monitoring. Ed. E T Brown - 1981
Mechanical Tests	Point load strength and anisotropy indices (loads from 0 to 46kN)	ISRM Commission on Testing Methods, Suggested Method for Determining Point Load Strength 1985

SUMMARY OF SOIL CLASSIFICATION TESTS

Test Report : FES /75604

Dear Mr Ashworth

Please find enclosed the results of the analysis carried out on the samples submitted from Meenaboll Landfill on Friday 11 April 2003.

I trust you will find these satisfactory but should you have any queries please contact me.

Yours sincerely

K Burrell
AUTHORISED SIGNATORY

INVESTOR IN PEOPLE

Business of the Year Winner 2001

Unless otherwise stated, CAS Ltd was not responsible for sampling. Information about methods and performance characteristics of the determinations are available on request. Unless otherwise agreed, as received soils will be disposed of after 30 days; dried soils after 30 days and waters/leachates after 10 days from the issue of the final report. Soil analysis is carried out on air-dried and ground test portions of the sample. Determinations marked $ were subcontracted.
