1.0 INTRODUCTION

White Young Green Environmental (Ireland) Ltd. (WYG) was commissioned by Mc Gill Environmental Systems (Ireland) Ltd. to undertake a noise assessment of the Molaisin Compost Ltd. composting facility at Kilmolash, Cappoquin, Co. Waterford.

The noise survey is part of an Environmental Impact Assessment (EIA) required for a waste licence application. The 6.5 acre site currently operates as a composting facility under a Waterford County Council issued waste permit.

The noise survey was undertaken during the daytime and night-time hours of the 1st of May 2008.

1.1 Site Description

The Molaisin Compost Ltd. site is located in a quiet rural setting approximately 4km from Cappoquin village. The surrounding land is mainly agricultural. The nearest noise sensitive receptors to the site are located approximately 200m west of the site and approximately 300m north of the site.

2.0 MEASUREMENT POSITIONS AND SURVEY DETAILS

For the survey a 30 minute (daytime) and 15 minute (night time) ambient noise level measurement was carried out at six locations, using an integrating sound level meter. Four measurements were carried out at the site boundaries (N1, N2, N3 and N4) and two of the nearest noise sensitive receptors (NSR1 & NSR2). Noise monitoring locations are illustrated in Figure 1 and described in Table 1 below.

Table 1: Description of Noise Monitoring Locations

| Location | Description of Location | Justification |
|----------|--|--------------------------|
| N1 | Eastern boundary | Boundary location |
| N2 | Northern boundary | Boundary location |
| N3 | Western boundary | Boundary location |
| N4 | Southern boundary | Boundary location |
| NSR1 | Located ~200m from the western boundary | Noise sensitive receptor |
| NSR2 | Located ~300m from the northern boundary | Noise sensitive receptor |

Weather conditions during the daytime survey were dry, calm and overcast. Weather conditions during the night-time survey were dry and calm. Wind-speed measured both during the daytime and nighttime monitoring periods was <2 meters per second (m/s).

At all monitoring locations the microphone was mounted on an outdoor microphone stand, which in turn was mounted on a tripod at 1.5m above ground level and at least 2m away from any sound reflecting objects. A windshield was placed on the microphone to reduce any wind interference during measurements.

2.1 Instrumentation and Methodology

The measurements were made according to the requirements of ISO 1996: *Acoustics – Description and Measurement of Environmental Noise, Part 1*, and the EPA "Environmental Noise Guidance Document". The measurements were made using a Cirrus 831A Data logging integrating sound level meter fitted with 1:1 and 1:3 Octave Band Filters. The instrument was calibrated *in situ* at 94 dB prior to and after use, using a Cirrus CR 513A acoustic calibrator. Factory calibration certificates for the noise level meter and acoustic calibrator, detailing equipment serial numbers, calibration traceability and re-calibration dates are presented in Appendix A of this report. The sound level meter was orientated towards the noise source for all measurements. This instrument is a Type 1 instrument in accordance with IEC 651 regulations. The Time Weighting used was Fast and the Frequency Weighting was A-weighted as per IEC 651. A glossary of noise related terms is presented in Appendix B.

2.2 Survey Implementation

The measurement duration was 30 minutes for the daytime survey and 15 minutes for the night time survey. A five minute one third octave reading was also taken at each location. The measurement parameters included meteorological observations of prevailing conditions at the time of the survey. The primary measurement parameter was the equivalent continuous A-Weighted Sound Pressure level, $L_{Aeq, T}$ over 30-minute measurement intervals for the duration of the day-time monitoring survey and 15 minute for the night-time survey.

A statistical analysis of the measurement results was also completed so that the percentile levels, $L_{AN, T}$, for N = 90% and 10% over 30-minute measurement intervals were also recorded.

L_{A10}

The noise level that is equalled or exceeded for 10% of the measurement period. The level is indicative of the contribution from traffic noise at the measurement location.

L_{A90}

The noise level that is equalled or exceeded for 90% of the measurement period. The L_{A90} readings are taken to represent the background noise levels.

L_{Aeq}

Equivalent continuous A-weighted sound level. The continuous steady noise level, which would have the same total A-weighted acoustic energy as the real fluctuating noise measured over the same period of time.

A 1/3rd octave frequency analysis was also carried out to determine whether a tonal character was present at the noise monitoring locations. High or very low frequency is considered to be more disturbing than middle range frequency noise. A tonal element exists if any given 1/3rd octave frequency band exceeds its adjacent bands by 5 dB or more (ISO 1996: Acoustics – Description and Measurement of Environmental Noise, Part 2). All sources of noise were noted, recorded and where possible, identified during each survey.

2.3 Assessment Criteria

The World Health Organization (WHO) recommends guideline values for noise levels in specific environments. Regarding the proposed development, the most applicable levels are presented in Table 2:

Table 2: WHO Recommended Guideline Noise Levels

| Specific Environment | Critical Health Effect(s) | L_{Aeq} , dB |
|----------------------|--|----------------|
| Outdoor Living Area | Serious annoyance, daytime & evening | 55 |
| Outside Bedrooms | Sleep disturbance window open (outdoor values) | 45 |

The noise criteria presented above is applicable at noise sensitive locations only; however, the recorded levels at boundary locations are compared to the above guideline values for comparison purposes only.

The noise limit levels set by the current waste permit levels follow the WHO recommended guideline levels at 55dB for daytime noise and 45 dB for night time noise.

The Environmental Protection Agency (EPA) defines a noise sensitive receptor as "any dwelling, house, hotel or hostel, health building, educational establishment, or any other facility or area of high amenity which for its proper enjoyment requires the absence of noise at nuisance levels".

3.0 NOISE SURVEY RESULTS

The noise measurement results for the day-time and night-time noise monitoring survey are reported in Tables 3 and 4 respectively. A graphical representation of noise measurement spectra, including octave band frequency analysis is presented in Appendix C.

Table 3: Daytime Noise Survey Results

| Monitoring Location | Survey Date & Time | L _{Aeq, 30 mins} dB | L _{A10,30 mins} dB | L _{A90,30 mins} dB | Wind speed m/s | Description of Sources |
|---------------------|--------------------|------------------------------|-----------------------------|-----------------------------|----------------|--|
| N1 | 09:55, 01/05/08 | 40 | 42 | 36 | <2 | A low constant noise from the extractor fans audible from the composting facility, operation of the HGV loaders (x2) audible, and birdsong. |
| N2 | 10:38, 01/05/08 | 67 | 88 | 60 | <2 | Operation of the HGV loaders (x2) plus intermittent reverse alarms dominant, constant noise audible from the extractor fans from the composting facility, and birdsong. |
| N3 | 11:10, 01/05/08 | 42 | 43 | 38 | <2 | Constant noise audible from the extractor fans dominant, operation of the HGV loaders in the composting facility audible, and birdsong. |
| N4 | 11:54, 01/05/08 | 52 | 74 | 49 | <2 | Constant noise audible from the extractor fans dominant, operation of the HGV loaders in the composting facility audible, and birdsong. Water turbulence from the waste water treatment plant, occasional on site HGV movement |
| NSR1 | 12:33, 01/05/08 | 46 | 48 | 41 | <2 | No noise audible from the composting facility, occasional traffic along the local road, farm animal noise audible and bird song |
| NSR2 | 13:08, 01/05/08 | 50 | 50 | 34 | <2 | No noise audible from the composting facility, occasional traffic along the local road, farm animal noise audible and bird song, distant construction noise to the east |

4.0 DISCUSSION**4.1 Daytime Noise****4.1.1 Site Boundaries**

At the Molaisin composting facility the daytime $L_{Aeq,30\text{mins}}$ recorded at the site monitoring locations (N1 – N4) ranged from 40 to 67 dB. The L_{A90} , which reflects the background noise level ranged from 36 to 60 dB and the L_{A10} , which represents traffic noise ranged from 42 to 88 dB.

The facility is located in a quiet rural setting. The predominant noise sources noted at the boundary locations comprised of the operation of the heavy goods vehicles (HGV) loaders for transporting the raw materials within the composting facility, the occasional delivery and collection HGV on site. Constant noise audible from the extractor fans from the composting facility, and birdsong.

4.1.2 NSR1 – West of the site

No audible noise from the facility was notable at this location the predominant noise source was distant non-site traffic birdsong and rustling of leaves from a light breeze. The relatively similar L_{Aeq} , L_{A90} and L_{A10} values of 46dB, 41dB and 48dB respectively are typical of the quiet rural setting of the site. The L_{Aeq} is below the recommended WHO guideline value of 55 dB.

4.1.3 NSR2 – North of the site

No audible noise from the facility was notable at this location, the predominant noise source was the occasional passing non-site traffic along the adjacent local road and distant construction noise to the east of the site. Birdsong and the rustling of leaves from a light breeze were also audible. The L_{Aeq} was measured at 50 dB which is below the recommended WHO guideline value of 55 dB. The L_{A10} was also measured at 50 dB. The similar L_{Aeq} and L_{A10} values of 50dB each indicate the dominant noise source to be from passing traffic. The L_{A90} , which represents background noise, was measured at 34 dB. The sound pressure level graphs corresponding to these monitoring locations show a few occasional peaks which can be attributed to short term noise events such as passing vehicles.

4.2 Night-time Noise**4.2.1 Site Boundaries**

At the Molaisin composting facility the daytime $L_{Aeq,15mins}$ recorded at the site monitoring locations (N1 – N4) ranged from 38 to 49 dB. The L_{A90} , which reflects the background noise level ranged from 27 to 48 dB and the L_{A10} , which represents traffic noise ranged from 39 to 64 dB.

The predominant noise sources noted at the boundary locations comprised of the low hum of the extractor fan located in the south western corner of the site and distant non-site traffic. Birdsong and the rustling of leaves were also audible.

4.2.2 NSR1 – East of the site

The predominant noise source at this location was the distant traffic flow to the east of the site; birdsong and the rustling of leaves were also audible. The L_{Aeq} value of 50 dB was recorded with an L_{A10} value of 43dB indicating traffic noise being the predominant noise while the L_{A90} , which indicates the background noise level, was 24 dB.

4.2.2 NSR2 – North of the site

The predominant noise source at this location was the distant traffic flow to the east of the site, birdsong and the rustling of leaves were also audible. The L_{Aeq} value of 52 dB was recorded with an L_{A10} value of 51 dB indicating traffic noise being the predominant noise while the L_{A90} , which indicates the background noise level, was 34 dB.

4.3 Octave Band Frequency Analysis

An octave band frequency analysis was also carried out as part of this assessment to obtain more detailed information regarding any potential tonal components at each of the noise monitoring locations. High or very low frequency noise is generally considered to be more disturbing than middle range frequency noise. In general, in order to minimise the potential for a noise source to be a nuisance or cause disturbance, any given 1/3-octave band must not exceed its adjacent band by 5 dB or more (cf ISO 1996 Part 2). The frequency spectra are presented in Appendix C.

The frequency spectra for day and night time monitoring are presented in tables 4 and 5 below and in graphical form in Appendix C.

Table 5: Day-Time Tonal Noise Survey Results

| Location | Frequency at which Tonal Noise was detected | Description of Sources |
|-----------------|--|---|
| N1 | 8kHz, 12.5kHz | The operation of extractor fans from the composting facility and the operation of the HGV loaders |
| N2 | 31Hz, 10kHz, 12.5kHz | The operation of extractor fans from the composting facility and the operation of the HGV loaders |
| N3 | 31Hz, 12.5kHz | The operation of extractor fans from the composting facility and the operation of the HGV loaders |
| N4 | 31Hz, 2.5kHz, 8kHz, 12.5kHz | The operation of extractor fans from the composting facility and the operation of the HGV loaders |
| NSR1 | 31Hz, 2.5kHz, 8kHz, 12.5kHz | Unidentifiable tonal noise. No audible tonal noise from the composting facility |
| NSR2 | 31Hz, 12.5kHz | Unidentifiable tonal noise. No audible tonal noise from the composting facility |

Table 6: Night-Time Tonal Noise Results

| Location | Frequency at which Tonal Noise was detected | Description of Sources |
|-----------------|--|---|
| N1 | 630Hz, 12.5kHz | Unidentifiable tonal noise. |
| N2 | 31Hz | The operation of extractor fans from the composting facility |
| N3 | 200Hz, 12.5kHz | The operation of extractor fans from the composting facility |
| N4 | 31Hz, 3.15kHz, 12.5kHz | The operation of extractor fans from the composting facility |
| NSR1 | 12.5kHz | Unidentifiable tonal noise. No audible tonal noise from the composting facility |
| NSR2 | 80Hz, 800Hz, 8kHz | Unidentifiable tonal noise. No audible tonal noise from the composting facility |

5.0 Summary

- For the daytime survey, one of the four boundary monitoring locations (N2) exceeded the guideline value of $L_{Aeq,30mins}$ 55 dB. The predominant noise at this location was mainly the operation of the loader HGV within the composting facility. The $L_{Aeq,30mins}$ at both NSR's were below the WHO recommended guideline value of 55 dB.
- For the night-time survey, one of the four boundary monitoring locations (N3) exceeded the guideline value of $L_{Aeq,15mins}$ 45 dB. The predominant noise at this location was the operation of the extractor fan within the composting facility. The $L_{Aeq,15mins}$ at both NSR1 and NSR2 exceeded the WHO recommended guideline value of 45 dB at levels of 50dB and 52 dB respectively.
- Tonal noise was detected at all noise monitoring locations
- No audible noise from the facility was notable at either NSR location during the day and night surveys. The predominant noise at both locations was distant traffic noise.

6.0 RECOMMENDATIONS

In order to minimize as far as practicable the noise impact of the Molaisín composting facility and other on-site noise generating activities the following mitigation measures are recommended:

- An investigation should be carried out into the source of the tonal noise noted during the survey. Once the source is identified mitigation measures should be developed in order to reduce the noise.
- The main access doors of the composting building should remain closed during the operation of the HGV loaders, to reduce noise emanating from the facility.
- Where practicable the use of quiet working methods should be selected and the most suitable plant should be selected for each activity, having due regard to the need for noise control.
- All mechanical plant used on site should be fitted with effective exhaust silencers and should be maintained in good working order. Where practicable, machines should be operated at low speeds and will be shut down when not in use.
- Where practicable the number of machines in simultaneous operation should be minimised.
- Plant and machinery used on-site should comply with the EC (Construction Plant and Equipment) Permissible, Noise Levels Regulations, 1988 (S.I. No. 320 of 1988).

Certificate of Calibration

Equipment Details

| | |
|-------------------------|---------------------|
| Instrument Manufacturer | Cirrus Research plc |
| Instrument Type | Sound Level Meter |
| Model Number | CR:831B |
| Serial Number | C18693FF |

Calibration Procedure

The instrument detailed above has been calibrated to the published test and calibration data as detailed in the instrument handbook, using the techniques recommended in the latest revisions of the International Standards IEC 61672-1:2002, IEC 60651:1979, IEC 60804:2001, IEC 61260:1995, IEC 60942:1997, IEC 61252:1993, ANSI S1.4-1983 and ANSI S1.43-1997 where applicable.

Sound Level Meters: All Calibration procedures were carried out by substituting the microphone capsule with a suitable electrical signal, apart from the final acoustic calibration.

Calibration Traceability

The equipment detailed above was calibrated against the calibration laboratory standards held by Cirrus Research plc, which are traceable to the appropriate National Standards.

The Cirrus Research plc calibration laboratory standards are:

| | | |
|--------------------------|-----------------------|-------------------------|
| Microphone Type B&K4192 | Serial Number 1920791 | Calibration Ref. S 5170 |
| Pistonphone Type B&K4220 | Serial Number 613843 | Calibration Ref. S 5291 |

Calibrated By

A handwritten signature in black ink, appearing to read 'ADB'.

Calibration Date

4 August 2006

Calibration Certificate Number

141905

This Calibration Certificate is valid for 12 months from the date above.

Appendix B

Appendix B

GLOSSARY

Ambient Noise

Totally encompassing sound in a given situation at a given time usually composed of a sound from many sources near and far.

Background noise level

The A-weighted sound pressure level of the residual noise at the assessment position that is exceeded for 90% of a given time interval, T measured using time weighting F, and quoted to the nearest whole number of decibels.

Day:

0800 hrs to 2200 hrs

Night:

2200 hrs to 0800 hrs

Decibel (dB)

The unit of sound pressure level, calculated as a logarithm of the intensity of sound. 0 dB is the threshold of hearing, 140 dB is the threshold of pain. A change of 1 dB is detectable only under laboratory conditions. A change of 10 dB corresponds approximately to halving or doubling the loudness of sound.

dB(A)

Decibels measured on a sound level meter incorporating a frequency weighting (A weighting) which differentiates between sound of different frequency (pitch) in a similar way to the human ear. Measurements in dB(A) broadly agree with peoples assessment of loudness.

Hertz (Hz)

Unit of frequency (pitch) of a sound.

Impulsive Noise

A noise which is of short duration (typically less than one second), the sound pressure level of which is significantly higher than the background.

1/3 Octave band analysis

Frequency analysis of sound such that the frequency spectrum is sub divided into bands of one third of an octave each. An octave is taken to be the frequency interval, the upper limit of which is twice the lower limit (in Hertz).

L_{Aeq}

Equivalent Continuous A-weighted Sound Level. The continuous steady noise level, which would have the same total A-weighted acoustic energy as the real fluctuating noise measured over the same period of time.

L(A)₁₀

The noise level that is equaled or exceeded for 10% of the measurement period.

L(A)₉₀

The noise level that is equaled or exceeded for 90% of the measurement period.

Noise

Unwanted sound. Any sound which has the potential to cause disturbance, discomfort or psychological stress to a subject exposed to it, or any sound which has the potential to cause actual physiological harm to a subject exposed to it or physical damage to any structure exposed to it, is known as noise.

Noise Sensitive Receptor

A noise sensitive receptor is regarded as any dwelling house, hotel or hostel, health building, educational establishment, places of worship or entertainment, or any other facility or area of high amenity which for its proper enjoyment requires the absence of noise at nuisance levels.

Rating level L_{A,TT}

The specific noise level plus any adjustment for the characteristic features of the noise.

Residual Noise

The ambient noise remaining at a given position in a given situation when the specific noise source is suppressed to a degree such that it does not contribute to the ambient noise.

Sound Power

The energy output from a source. It is measured in Watts (W).

Specific Noise source

The noise source under investigation for assessing the likelihood of complaints.

Tone

A noise with a narrow frequency composition.

Measurement Report

Measurement Details

Date and Time: 01/05/2008 13:03
 Sound Level Meter: Cirrus Research plc
 Recalibration Due: 31/08/2008
 Run Duration: 00:04:16 hh:mm:ss
 Range: 30-100 dB
 Location: NSR1_F_Day
 Notes:

Noise Monitoring Location NSR1, 1/3 Octave Frequency Analysis

Data

| Band | L _{Zeq,t} | Time s | Overload | Band | L _{Zeq,t} | Time s | Overload | Band | L _{Zeq,t} | Time s | Overload |
