

ATTACHMENT I2 – ASSESSMENT OF WASTE WATER DISCHARGE

There are no emissions to public (Local Authority) sewers associated with the operation of the proposed waste recovery facility.

Roadstone Wood Ltd. has two existing wastewater effluent (septic) tank on its property at Brownswood, both of which are located within the application site. One is located to the south of the existing canteen and services toilets, wash-hand basins and sink units. The other is located to the west of the existing site office and also services toilets, wash-hand basins and sink units. As these facilities will be shared by staff working at the proposed waste recovery facility for the duration of quarry backfilling and restoration works, there will be negligible additional impact on soil or groundwater quality.

No other emissions to wastewater sewers will arise as a result of the proposed waste recovery activities.

Details of the proposed sewerage and surface water management system at the application site are provided in Chapter 2, Paragraphs 2.27 to 2.35 of the Environmental Impact Statement. An assessment of the impact of waste recovery activities on surface water and groundwater is provided in Chapter 6 of the Environmental Impact Statement.
