Abstract: This report presents the Annual Environmental Report for Balleally landfill,

Balleally, Lusk, Co. Dublin to the Environmental Protection Agency. The report covers the annual reporting period of 2011, in accordance with Waste Licence Reg.

No. W0009-03.

Section 1

Introduction

1. INTRODUCTION

In 2000 Fingal County Council (FCC) was granted a Waste Licence, Reg. 9-1 to continue operating Balleally Landfill. In July 2001 FCC applied for a review of this licence. On the 8th January 2003 the Environmental Protection Agency (EPA) issued FCC a second waste licence for Balleally Landfill: Waste Licence W0009-02. This licence supersedes the previous licence 9-1 and it permits the operation of a non-hazardous landfill. Waste licence number W0009-03 came into action on the 21st December 2009. In accordance with the requirements of Condition 11.6 of the Waste Licence, an Annual Environmental Report (AER) for the facility must be submitted to the EPA.

This report was part written by both Fehily Timoney & Company (FTC) and FCC. FTC wrote the environmental monitoring section (sections 3.1 through section 3.6), while FCC wrote all other sections. The report was compiled by FTC on behalf of FCC.

1.1 Reporting Period

The reporting period for the AER is 1st January to 31st December 2011. This is the 11th AER for the facility as required by the waste licence. This AER applies to the licence W0009-03.

1.2 Facility Location

FCC has responsibility for the management and operation of the facility. The facility is located at:

Balleally Landfill, Balleally Lane, Lusk, Co. Dublin

Tel. / Fax. (01) 8431600

National Grid reference: 322500 252200.

Drawing DE07-164-03-001-(C) included in Appendix I presents a map of the facility and the surrounding locations.

1.3 Environmental Policy for Balleally

- Comply with the terms of our waste licence and all other relevant legislation and codes of practice.
- Strive for continuous improvement in the running of the facility, in order to minimise the effects of the landfill on the environment.
- Create better awareness and training for all staff involved in the running of the landfill.
- Develop a good relationship with local residents around Balleally for the betterment of the surrounding area.

J: LW10/164/02/Rpt004-0.doc Page 1 of 75

Section 2

Site Description, Waste Activities & Records

2. SITE DESCRIPTION, WASTE ACTIVITIES & RECORDS

Balleally Landfill is situated in Lusk, Co. Dublin. It has been in operation since 1971. Waste activities at the facility include landfill, special handling, a construction and demolition (C&D) recycling facility (which ceased in August 2005 due to capping commitments) and a civic amenity site (which ceased in December 2008 due to capping / operational commitments).

Condition 4.2 of W0009-03 restricts waste filling activities to meet Figure 2 of the 'Landscape Master Plan'. The final height of the facility shall be as shown in Figure 2 of the 'Landscape Master Plan'. The final height of the facility peak shall not exceed 40 mOD Malin Head.

On January 8th 2003 FCC was licensed to carry out the following waste activities at Balleally Landfill, Lusk, Co. Dublin subject to twelve conditions.

2.1 Licensed waste activity at the facility

Licensed waste disposal activities, in accordance with the Third Schedule of the Waste Management Act, 1996.

- Class 1: Deposit on, in or under land (including landfill).
- Class 5 Specially engineered landfill, including placement into lined discrete cells, which are capped and isolated from one another and the environment.
- **Class 10** Release of waste into a water body (including a seabed insertion).
- Class 12 Repackaging prior to submission to any activity referred to in a preceding paragraph of this Schedule.
- Class 13 Storage prior to submission to any activity referred to in a preceding paragraph of this Schedule, other than temporary storage, pending collection, on the premises where the waste concerned is produced.

Licensed waste recovery activities, in accordance with the *Fourth Schedule* of the Waste Management Act, 1996.

- Class 2: Recycling or reclamation of organic substances, which are not used as solvents (including composting and other biological transformation processes).
- **Class 3:** Recycling or reclamation of metals and metal compounds.
- **Class 4:** Recycling or reclamation of other inorganic metals.
- **Class 9:** Use of any waste principally as a fuel or other means to generate energy.
- Class 11: Use of waste obtained from any activity referred to in a preceding paragraph of this Schedule.
- Class 13: Storage of waste intended for submission to any activity referred to in a preceding paragraph of this Schedule, other than temporary storage, pending collection, on the premises where such waste is produced.

J: LW11/164/01/Rpt004-0.doc Page 3 of 75

2.2 Total Quantity of Waste Accepted & Deposited

Waste received at Balleally to be disposed of at the landfill is weighed at the weighbridge on entry. Construction and demolition (C&D) material is also weighed and then stockpiled or used immediately for use in Specified Engineering Works (SEW). The quantity and composition of waste received, disposed of and recovered during the reporting period is detailed in Table 2.1.

Table 2.1: Quantity and composition of waste received at the facility 2005 - 2011

Location & Waste Type	Waste Deposited (tonnes) in 2006	Waste Deposited (tonnes) in 2007	Waste Deposited (tonnes) in 2008	Waste Deposited (tonnes) in 2009	Waste Deposited (tonnes) in 2010	Waste Deposited (tonnes) in 2011

Note: -Table does not include materials used in SEW.

2.3 Remaining landfill capacity

As part of the Waste Management Strategy for the Dublin Region an extension to the landfill facility was applied for by reviewing the then current licence W0009-01. This was granted on 8th January 2003 (W0009-02) and Priority Construction Ltd. under the supervision RPS-MCOS were appointed to construct 6 No. lined cells at Balleally to provide an additional capacity of 1.29 million m3. Filling of Cell 1 started on 1st April, 2004 – Table 2.2 for information on inputs to date.

Filling of:

- Cell 1 commenced 1st April, 2004
- Cell 2 commenced 8th June, 2004
- Cell 3 commenced-22nd June, 2005
- Cell 4 commenced 6th October, 2006
- Cell 5 commenced 23rd August, 2007
- Cell 6 commenced 15th December, 2008
- Cell 5 & 6 Piggybacking 2009

The remaining capacity in the landfill was surveyed in September 2010. Remaining capacity at the end of 2010 was estimated at 120,000 tonnes.

J: LW11/164/01/Rpt004-0.doc Page 4 of 75

Table 2.2: Air Space Reconciliation for the Facility, 2011

Description	Tonnes	Cubic Metres

Total Inputs Jan-Dec 2008	112,457.00	
Total Inputs Jan-Dec 2009	98,560.00	
Total Inputs Jan-Dec 2010	96,459.28	
Total Inputs Jan-Dec 2011	91,834.47	
TOTAL	962,923.41	1,203,654
LICENCE LIMIT WL0009-03	1,032,000	1,290,000
Remaining Licence Limit	69,077	86,346

Table does not include materials used in SEW.

Waste density of 0.85 tonnes/m³ used for above calculations

Void Space: Total Filled + Total Remaining $1,290,000 \text{ m}^3 = 1,203654 \text{ m}^3 + 86,346 \text{ m}^3$

2.3.1 Balleally landfill short term extension

The extension to the facility is approximately $98,200 \text{ m}^2$ (surface area) with composite liner system and leachate collection system together leachate collection chambers. It provided for approximately 1.04 million tonnes of waste.

Table 2.3: Void Space at Balleally Landfill Extension

Cell	Plan Area <i>m</i> ²	Surface Area m ²	Void Space <i>m</i> ³	Void Space (tonnes)
Cell 1	15000	18000	193,373.00	164,367.05
Cell 2	18200	19000	306,338.00	260,387.30
Cell 3	13600	14300	204,001.00	173,400.85
Cell 4	15300	16500	265,933.00	226,043.05
Cell 5	16200	17300	283,991.00	241,392.35
Cell 6	12200	13100	160,101.00	136,085.85
Total	90,500	98,200	1,413,737	1,201,676.45

J: LW11/164/01/Rpt004-0.doc Page 5 of 75

Assumptions:

- Geosynthetic Capping of 1.06 m.
- 10% Daily cover to be absorbed by settlement
- Waste density of 0.85 tonnes/ m³

The remaining capacity in the landfill was surveyed in September 2010; See Table 2.4. For remaining capacity at the end of 2011.

Table 2.4: Remaining void space estimated at beginning of January 2012 (Revised Survey of Remaining VOID SPACE; Jan 2011)

Void Space	Remaining Void Space (tonnes)
JAN 2012	26,374

2.4 Local environmental conditions

Balleally landfill site covers 50 ha in total. The east face of the landfill is bordered by the Dublin-Belfast railway line and to the south by Rogerstown Estuary. See Drawing DE07-164-03-001-(C) included in Appendix I.

The former landfill facility was approximately 40ha. The extension to this facility to the north west of the site (OS National Grid Ref. 3225E 2522N) consists of a new engineered lined cell (approximately 10 Ha). The primary objective of its design is to prevent or reduce negative effects on the environment arising from landfilling of waste.

All waste is deposited in a limited working face, covered daily and surrounded by soil bunds. The entire site is surrounded by perimeter berms to reduce the visual impact and to create shelter to minimise the conditions that create windblown litter.

J: LW11/164/01/Rpt004-0.doc Page 6 of 75

Section 3

Environmental Monitoring

3. ENVIRONMENTAL MONITORING

All original monitoring results certificates issued by Alcontrol Laboratories Ltd., for surface water, groundwater, leachate results and from Southern Scientific Services Ltd., for dust and particulate monitoring have been already included and submitted to the EPA in the four quarterly reports submitted during the reporting period. The original results certificates are not included again in this report. This report only presents summary data.

3.1 Groundwater

This section of the Annual Environmental Report presents the groundwater monitoring results.

3.1.1 Monitoring Locations

Groundwater monitoring was carried out at the locations shown on Drawing DE07-164-03-001-(C), Appendix I. As part of a previous extension to the landfill a number of the boreholes stipulated in W0009-02 are no longer accessible. During July 2004 a revised monitoring schedule was agreed with the Environmental Protection Agency (EPA) on which the present monitoring is based. Details of the groundwater locations now monitored are presented in Table 3.1.

Monitoring location MB18 is located up-gradient, approximately 535 m north of the landfill on private agricultural land. Access to the monitoring location was not granted during the monitoring period.

Table 3.1: Groundwater Monitoring Locations

Station	Classification	Easting	Northing
MB18	Eastern Upgradient	323 245	252 783
RC3	Western Upgradient	321 906	252 729
MB35	Southwestern Downgradient	322 029	251 906
CD1	Control Drain N/W of Cell 1	322 008	252 356

3.1.2 Location Description

Borehole MB35

This borehole is situated approximately 190 m south of the landfill on the edge of the Inner Rogerstown Estuary, downgradient of the landfill.

Location CD1

The control drain sampling location CD1 is situated approximately 30 m south of Balleally Lane west of the landfill extension. This drain collects groundwater from underneath the newly constructed lined cells.

MB18

This is an upgradient private well of Rogerstown House which lies to the north east of the landfill site along the estuary.

RC3

This upgradient borehole is situated approximately 535 m north of the landfill on private agricultural land.

J: LW11/164/01/Rpt004-0.doc Page 8 of 75

3.1.3 Monitoring Parameters

Groundwater levels were monitored and a visual assessment was performed on a monthly basis at all groundwater wells. Groundwater monitoring location CD1 is sampled monthly and analysed for quarterly groundwater parameters, listed in Table D.5.1 of the Waste Licence. MB35 and RC3 are sampled quarterly and analysed for quarterly groundwater parameters, listed in Table D.5.1 of the Waste Licence.

Annual groundwater monitoring was also undertaken for CD1, MB35 and RC3 and the results are presented in Table 3.2

3.1.4 Interpretation of Results

Table 3.2. presents a summary of the groundwater chemical analysis results.

The groundwater results have been compared to the relevant Interim Guideline Value (IGV) set out in the EPA report 'Towards Setting Guideline Values for the Protection of Groundwater in Ireland'. It should be noted that the groundwater beneath the landfill is likely to be estuarine in nature and would not generally be considered to be potable water.

Monthly monitoring at CD1 shows that chloride results varied through the reporting period with a sharp increase in Decembers results. Results were observed higher in quarter 1 and fell during quarter 2 and quarter 3, only to increase again in quarter 4. BOD results remained constant through the reporting period. COD results fluctuated during the reporting period with a spike in quarter 2 and 4 before returning to more normal levels during December (Figure 3.1).

Quarterly monitoring at groundwater locations indicates that ammoniacal nitrogen levels are lower up gradient at RC3 than down gradient at MB35, suggesting potential landfill impact down gradient (Figure 3.2).

The quarterly chloride (Figure 3.3) and electrical conductivity (Figure 3.4) plots follow a similar trend to each other. Results from both RC3 and CD1 are similar with elevated chloride and electrical conductivity results found in all samples at MB35.

Both chloride and electrical conductivity levels are lower up-gradient at RC3, increasing slightly on-site at CD1 and then greatly down-gradient at MB35. It is observed that upgradient chloride levels at RC3 are elevated above the IGV level (30 mg/l Cl) during all first two quarters with the results for quarter 3 for the only chloride results below the IGV level during the reporting period.

Electrical conductivity results from RC3 are under the IGV level (1 mS/cm) for three out of the four quarters with quarter one slightly above the IGV level at 1.798 mS/cm. All results for CD1 and MB35 are elevated above the IGV level.

It is likely that this trend in chloride and electrical conductivity values are indicative of saline water intrusion at location MB35 due to its position in close proximity to the Rogerstown estuary. Saline intrusion may also be influencing CD1 and RC3, to a degree.

J: LW11/164/01/Rpt004-0.doc Page 9 of 75

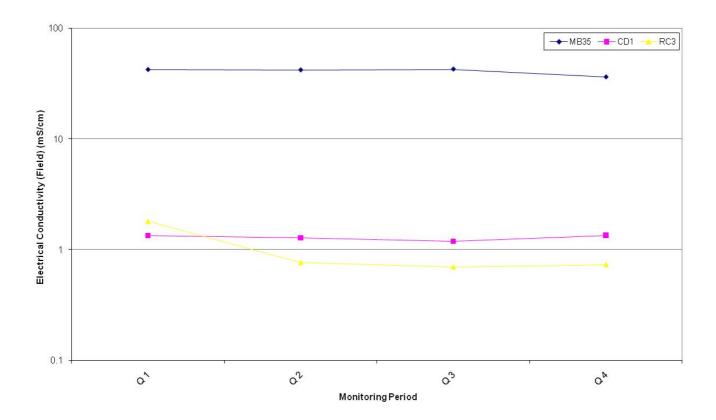

Figure 3.4: Quarterly Electrical Conductivity Monitoring Results

J: LW11/164/01/Rpt004-0.doc Page 12 of 75

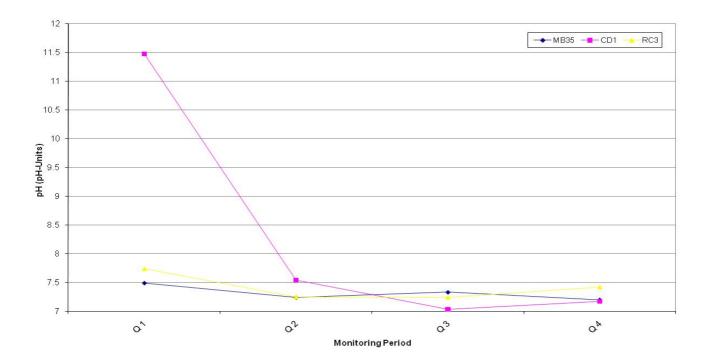

Figure 3.5: Quarterly pH Monitoring Results

3.1.5 Conclusion

Groundwater results indicate that water quality is impacted by both the landfill (which is both dilute and disperse and engineered designed aspects) and the nearby estuary, in terms of salinity sources from the estuary. Quarterly monitoring at groundwater locations indicates that ammonical nitrogen levels are lower up gradient at RC3 than down gradient at MB35, suggesting potential landfill impact down-gradient.

Groundwater results at MB35 showed impact from saline intrusion in chloride and electrical conductivity results, while saline intrusion may also be influencing CD1 and RC3, to a degree.

3.2 Surface water monitoring

This section of the Annual Environmental Report presents the surface water monitoring results.

3.2.1 Introduction

Schedule D of the waste licence requires the monitoring of surface water. The surface water monitoring locations are predominately upstream of the landfill footprint.

3.2.2 Monitoring Locations

The sample locations can be seen in Drawing DE07-164-03-001-(C), Appendix I and are presented in Table 3.3.

J: LW11/164/01/Rpt004-0.doc Page 13 of 75

Table 3.3: Surface water monitoring locations

Monitoring ID	Easting	Northing
SWFD	322 036	252 412
SWV1	321 980.2	252 187.4
S3	322 985	252 692
S7	322 646	253 213
SW20a	322 897	252 687

SWFD

Discharges to an open drain immediately west of the entrance to the wastewater treatment plant.

SWV1

The surface water discharge at the Western Point Surface Water Outfall – The samples are collected in the open channel immediately upstream of the discharge pipe/cut-off flap.

S3

This sampling point is located on a stream to the north east edge of the landfill site prior to its discharge to the estuary.

*S*7

This sampling point is located upstream of the site on the stream to the north of the landfill site.

SW20a

This sampling point is located at a drainage ditch to the east of Rogerstown Lane, close to the north-eastern tip of the landfill, currently bunged.

SW1

At the request of the EPA, FCC was required to re-start monitoring at SW1, in Quarter 1, 2010, however monitoring at this point ceased following recommendations by the EPA during a site audit of 31st May 2011.

3.2.3 Monitoring Parameters

Environmental samples taken at the site were submitted for analysis in accordance with Table D.5.1 of Waste Licence W0009-03. As required, a monthly visual assessment of all surface water monitoring locations was undertaken.

Chemical analysis of surface water monitoring point S3 is required monthly. It is analysed monthly for quarterly parameters, so that the surface water chemistry can be characterised. These parameters included pH, temperature, conductivity, Chemical Oxygen Demand (COD), ammoniacal nitrogen, Biochemical Oxygen Demand (BOD), total suspended solids, dissolved oxygen and chloride. Chemical analysis of all surface water sampling points is carried out on a quarterly basis for the parameters listed in Table D.5.1 of Waste Licence W0009-03.

3.2.4 Monitoring Results

The visual assessment results and the full surface water analysis datasets as issued by the Laboratory have been previously submitted in the individual quarterly reports during the reporting period.

J: LW11/164/01/Rpt004-0.doc Page 14 of 75

A summary of the results is presented in Table 3.4 and continued in Table 3.5. A summary of the monthly chloride, ammoniacal nitrogen, COD and BOD results for samples taken at S3 are shown in Figure 3.5. Quarterly results for all surface water monitoring locations are presented in Figure 3.6 to Figure 3.10.

3.2.5 Interpretation of Results

The surface water results have been compared to maximum admissible concentrations (MAC) as outlined in the Surface Water Regulations, 1989. It can be seen from the results that over the course of the year, several parameters were elevated above the regulations (Table 3.4 & 3.5).

The parameters examined were chosen because they are likely indicators of leachate impact, but they also may demonstrate impact by other sources, such as sewage or the nearby estuary.

For the monthly S3 sample analysis (Figure 3.6), stable COD results for the majority of the annual monitoring were observed. July August and September were all recorded above the MAC levels (40 mg/l). BOD is also under the MAC (5 mg/l) during the reporting period. There is a slight variability also noted in the Chloride results, with July and August recorded above the MAC (250 mg/l Cl).

Electrical conductivity levels (Figure 3.7) varied throughout the monitoring period with S7 recorded below the Mac for the entire period. S3 results fluctuated with a peak in quarter 3. SW20A and SWV1 were recorded above the Mac for the entire period with peaks in quarter 3. SWFD also varied throughout the period with quarter 1 and 4 above the MAC.

While higher chloride levels were recorded in SWV1 and S3 (quarter 3) all other results for the monitoring period are under the MAC (250 mg/l Cl) (Figure 3.8). SWFD, S3 and S7 present the lowest chloride results in all analysed samples.

Results elevated above the COD MAC (40 mg/l) were recorded in SWV1, S3 and SW20a (Figure 3.9). Results for SWFD and S7 were all under the MAC for all samples analysed. A single result for S3 during quarter 3 was elevated above the MAC level.

With the exception of SW20A in quarter 3, all BOD samples were under the MAC (5 mg/l) during the monitoring period (Figure 3.10).

Ammonical nitrogen levels (Figure 3.11) are slightly elevated ranging between <0.2 mg/l to 83.7 mg/l during the reporting period, suggesting potential landfill impact. With the exception of SWFD and S7, which is located circa 700 m north of the site, all other monitoring locations have high ammoniacal nitrogen levels.

3.2.6 Surface Water Improvements

The ongoing capping programme and final restoration of the landfill will control and contain the breakouts which occasionally occur near the entrance. The shallow vertical barrier surrounding the facility will be completed at the entrance as part of the closure plan. This should help contain any contamination of surface water with leachate into the future.

Remedial works were undertaken during quarter 2, 2009 to protect the surface water drain / ditch in the vicinity of SW20A. A 50 m length of the drain/ditch was excavated and cleaned prior to lining with low-permeability clay and a HDPE liner pinned and stabilised to the underlying clay bank. These two layers of impermeable material serve to minimise inputs into the drainage ditch. Further works are planned Q1, 2012 to protect the ditch at SW20a.

The ditch adjacent to SW20a was re-graded with stone fill, which allows the movement of water through the gravel. A manhole access point was built to facilitate visuals assessment and the required periodic environmental sampling.

There is no flow into the estuary from SW20a as the outfall point is bunged.

After closure the landfill investigation of the vertical barrier adjacent to SW20a will be undertaken in order to assess if seepage is getting through the barrier and potentially resulting in contamination at SW20a.

3.2.7 Conclusions

Surface water results indicate that water quality is impacted by both the landfill (which is both a dilute and disperse land an engineered designed landfill) and the nearby estuary, in terms of salinity sources from the estuary.

Some improvements in surface water quality have been noted through the monitoring period although results over MAC levels are also noted. However, chloride and electrical conductivity levels at SW20a have shown improvements during the reporting period.

A review of surface water contamination is ongoing since August 2011; this review will be the subject of a report that is being prepared for submission to the EPA in quarter 2, 2012. This report will detail the investigations and mitigation measures carried out during this review.

3.3 Leachate Monitoring

Leachate monitoring was carried out at the monitoring locations as defined in Schedule D of Waste Licence W0009-03 and shown on Figure DE07-164-03-001-(C), Appendix I.

Leachate monitoring locations L19 - L21 were removed during the on-going capping works occurring during the reporting period. Capping works have also been on-going along the southern boundary of the landfill and as a result a number of wells were noted to be destroyed or were inaccessible with the result that no sample was obtained for analysis, namely:- LMW2 (covered with soil), LMW8 (blocked on one occasion), LMW15 (destroyed), and LMW 16 (inaccessible due to height of casing). The status of leachate monitoring wells is summarised in Table 3.5.

A proposal was submitted to the agency from FCC during 2010 with the intention of upgrading and replacing a number of the leachate wells on-site.

During 2011 additional Leachate wells were drilled in to facilitate areas where wells had been destroyed or were deemed to be inaccessible. These wells are shown in shown on Figure DE07-164-03-001-(C), Appendix I. From 2012 on these additional wells will be monitored.

J: LW11/164/01/Rpt004-0.doc Page 21 of 75

3.3.1 Monitoring Parameters

Waste Licence W0009-03 requires that a visual assessment is undertaken and the leachate level in every second well is monitored and recorded monthly. Chemical analysis of leachate samples is taken annually.

3.3.2 Monitoring Results

Leachate level results since May 2007 are presented in Figure 3.12.

3.3.3 Interpretation of leachate level Results

A trigger level of 5.5 meters above ordnance datum (m AOD) for wells between LMW1 to LMW18 has been established, to indicate when there is too much liquid in the landfill. Leachate was recorded above the trigger level at a number of locations, highlighted in Figure 3.12.

From the results it can be seen that by the end of the reporting period (December 2011) all leachate wells were under the 5.5 m AOD trigger level apart from LMW3, LMW5 and LMW6. LMW3 was below the trigger level of 5.5 m AOD during most monitoring events of the reporting period.

It is observed by site management that the leachate monitoring wells are set back from the vertical clay barrier by 18-20 m. The hydraulic gradient is likely to fall between the leachate monitoring wells and the vertical clay barrier. Consequently the levels at these wells may not reflect the leachate levels at the vertical clay barrier.

It is further observed by site management that P1a & P1b are fully open and thus the northern and southern leachate lines are fully open. Therefore leachate should not be building up in the body of the landfill.

Nevertheless, in accordance with the ERP trigger levels, visual assessments were conducted on these slopes and there is no evidence of leachate break-out. This would corroborate the comments outlined above. A proposal was sent to EPA to install wells adjacent to the vertical barrier to test this hypothesis. These wells have now been installed and will be reported from 2012.

3.3.4 Leachate Quality

This section presents a summary of the chemical results. The results for leachate monitoring presented in Table 3.6.

The pumping chamber receives leachate from a number of different locations on-site. As it collects leachate from a number of different areas over the site it is representative of general leachate quality over a greater time period than the individual grab samples from each of the leachate wells. The pumping chamber collects leachate from:

- Pipe 1A New cells
- Pipe 1B Old northern boundary
- Pipe 1C Southern boundary

The results of leachate sampled from the pumping chamber reflect the results obtained from the individual wells on the landfill.

It is noted that the results for the southern boundary are slightly more concentrated, than the results along the eastern boundary. In general, the reported concentrations for the leachate sample are consistent with the typical composition of leachate sampled from large landfills and in line with the levels presented in the Environmental Protection Agency (EPA) Landfill Manual on Landfill Site Design (2000).

3.3.5 Volume of Leachate transported off-site for treatment:

A water balance for the reporting period has been prepared and is included as Table 3.7. The water balance calculation is derived from EPA Landfill Manuals "Landfill Site Design" (EPA, 2000; p59) and indicates that there was $25,287 \, \text{m}^3$ of Leachate Produced at the Landfill. Infiltration rate used was 5% for capped areas and 25% for temporary capped areas.

Leachate tankered off-site was recorded at $37,794 \text{ m}^3$. The volume of leachate tankered off-site was greater than estimated in water balance, but some contaminated water pumped to plant may account for this.

3.3.6 Leachate Treatment Plant

Operation of the leachate treatment plant was suspended during Q2, 2009. During 2009, FCC applied for a Full Licence Review of the Waste Licence for the site. The Waste licence review was seeking to remove Chemical Oxygen Demand (COD) as a leachate plant Emission Limit Value (ELV) and to raise the ELV levels for some of the other leachate treatment plant parameters. This application was withdrawn and FCC will be seeking a technical amendment to existing licence based on partial treatment and pumping to Portraine Waste Water Treatment Plant.

In the interim period the leachate treatment plant operation will remain suspended and leachate will continue to be tankered off-site.

3.4 Noise Monitoring

Noise surveys were undertaken during every quarter of the monitoring period (2011) in order to assess the existing noise emissions from the site and to establish the existing noise environment at potentially sensitive receptors near the site in accordance with Schedule D of Waste Licence W0009-03. Noise monitoring was carried out during daytime hours. The location of noise monitoring points can be seen in Figure DE07-164-03-001-(C), Appendix I and presented in Table 3.10.

Noise measurements were taken for 30 minutes at each location.

Noise emission limits are given in Table C.1 of the waste licence and are reproduced here in Table 3.11.

Table 3.8: Noise Monitoring Locations

Monitoring Location	DESCRIPTION	Northings	Eastings
NM1	Situated adjacent to the northeastern boundary of the site.	321 919	252 357
NM2	Situated north east of the site boundary adjacent to Balleally Lane.	321 779	252 415
NM3	Situated East of the landfill 120m along Balleally Lane.	321 459	252 383
NM4	Situated north of the landfill along Rogerstown Lane.	322 604	252 962
NM5	Situated north of the landfill along Rogerstown Lane.	322 970	254 004

3.4.1 Monitoring Results

A summary of the quarterly monitoring results are presented in Table 3.10 to Table 3.13.

J: LW11/164/01/Rpt004-0.doc Page 27 of 75

Table 3.10: Quarter 1 Noise Monitoring Results

Location	Date	Time	Tonal	LAeq	LAF90	LAF10	Comments
NM1	2011 Feb 14	13:21:31	ı	09	52	62	Dry conditions with a light breeze present during monitoring, resulting in low level rustling of leaves. The results were most influenced by passing vehicles, which were limited to single direction movements in pulses due to road works occurring adjacent to the noise monitoring location. Road works noise dominated during monitoring, including engines in idle, shouting and the occasional use of a jack-hammer. No sounds from site could be observed at this location.
ZWN	2011 Feb 14	14:00:44	1	65	20	99	Dry conditions with a light breeze present during monitoring. Monitoring at this location was dominated by road works occurring adjacent to the noise monitoring locations. This included occasional use of a jack-hammer. Due to traffic control measures employed during the works, traffic movements were controlled to single directions movements occurring in pulses. No sounds from site could be observed at this location.
NM3	2011 Feb 14	15:22:37	1	64	46	89	Dry conditions with a slight breeze present during monitoring. Light rustling of leaves. Monitoring results at this location were dominated by roadwork's occurring on ROAD NAME. A truck was in idle adjacent to the noise monitoring location for most of the monitoring period, revving the engine occasionally. Distance traffic noise could also be heard on occasions. 2 no. overhead planes were also recorded.
NM4	2011 Feb 14	11:58:18	ı	50	45	51	Dry conditions with a light breeze present during monitoring. The results were influenced by sewer construction works, including the sound of tracked machinery movements and a jack-hammer. Distant road traffic could also be heard at this location. 4 No. overhead planes and 2 no passing vehicles were recorded during the monitoring period, contributing to the dominant noise environment. Intermittent birdsong and bird scare bangers contributed to the background noise levels in the area.
NM5	2011 Feb 14	11:23:40	ı	49	44	51	Dry conditions with a light breeze present during monitoring. The results were most influenced by 6 no. passing vehicles recorded during the monitoring period on ROAD NAME. 2 no. overhead planes were also recorded during the monitoring period. Construction works on the sewer nearby contributed to the dominant noise at this location. Intermittent birdsong and bird scare bangers contributed to the background noise levels in the area.

Table 3.11: Quarter 2 Noise Monitoring Results

Location	Date	Time	Tonal	LAeq	L _{AF90}	LAF10	Comments
N1	2011 Jun 21	11:42:43	1	53.5	41.4	56.4	Still calm conditions with a slight breeze. Slight rustling of vegetation in breeze. Passing traffic and Banger for birds. Constant strimmer noise from site. WWTP, Overhead plane. Loud birdsong.
N2	2011 Jun 21	14:12:53	1	6'69	41.2	9.63	Passing vehicles, banger for birds and overhead plane dominant sounds. Slight breeze. Slight rustling of leaves in breeze. Dogs barking in distance, birdsong and reversing beacons beside monitoring point
EN	2011 Jun 21 13:36:43	13:36:43	1	57.2	43.4	8'55	Passing vehicles, banger for birds and overhead plane dominant sounds. Slight breeze. Slight rustling of leaves in breeze. Birdsong intermittent
N4	2011 Jun 21	13:18:11	1	1.93	39.0	49.2	Slight wind, rustling of leaves in breeze. Engines on site with reversing beacons. Birdsong intermittent. Dominant noise was passing vehicles, banger for birds and overhead plane.
N5	2011 Jun 21	12:30:06		47.3	38.8	49.8	Slight breeze. Low level rustling of leaves in the breeze. The dominant noise distant engines on site, with a low level hum from site and occasional reversing becons evident. Birdsong evident in the background.

Table 3.12: Quarter 3 Noise Monitoring Results

Location	Date	Time	Tonal	LAeq	LAF90	LAF10	Comments
N1	2011 Sep 29	13:15:51		52	39	51	Dry, still calm conditions with a slight breeze. Slight rustling of vegetation in low breeze. 20 passing vehicles on Balleally Lane and 1 overhead planes were also recorded during monitoring dominated the noise environment. Birdsong and insects contributed to the background noise environment.
N2	2011 Sep 29	12:21:05		63	38	58	Dry, still calm conditions with a slight breeze. Slight rustling of vegetation in low breeze. 23 passing vehicles on Balleally Lane dominated the noise environment. 4 overhead planes were also recorded during monitoring. Distant site sounds and birdsong contributed to the background noise environment.
N3	2011 Sep 29	11:45:58		55	37	50	Dry, still calm conditions with a slight breeze. Slight rustling of vegetation in low breeze. 1 overhead plane and 16 passing vehicles contributed to the dominant noise environment. Some distant vehicle engines could be heard from site. Distant traffic sounds also audible. Birdsong contributed to the background noise levels.
N4	2011 Sep 29	11:08:33		51	40	50	Dry, still calm conditions. 1 overhead planes, 3 passing trains and 5 passing vehicles on Rogerstown Lane were recorded during the monitoring period, contributing to the dominant noise environment. Some distant engine sounds and occasional reversing becons could be heard from the site. Intermittent birdsong and a barking dog contributed to the background noise levels in the area.
N5	2011 Sep 29	10:31:49		48	36	49	Dry, still calm conditions with a slight breeze. Slight rustling of vegetation in low breeze. The results were influenced by 5 passing vehicles recorded during the monitoring period on Rogerstown Lane. 2 overhead planes and 3 trains were also recorded during the monitoring period. Some distant engine sounds and occasional reversing becons could be heard from site. Intermittent birdscare bangers could also be heard. Birdsong and occasional dog barking contributed to the background noise levels.

Table 3.13: Quarter 4 Noise Monitoring Results

Location	Date	Time	Tonal	LAeq	LAF90	LAF10	Comments
NM1	2011 Nov 15	14:55:25	No	53	41	56	Weather conditions were dry and bright with calm, still wind conditions. Noise sources during the monitoring period at this location included passing vehicles (c. 20 no.), overhead planes (c.5 no.) and birdsong. Onsite noise sources audible at this location during the monitoring period included reversing sirens.
NM2	2011 Nov 15	16:59:31	No	62	42	52	Weather conditions were dry and bright with calm, still wind conditions. Noise sources at this location during the monitoring period included 8 passing vehicles, distant traffic, 2 trains and 3 overhead planes. Voices, birdsong and dogs barking were also audible at this location. Some engine sounds and occasional reversing beacons could be heard from the site.
NM3	2011 Nov 15	13:45:24	No	56	40	53	Weather conditions were dry and bright with calm, still wind conditions. Noise sources during the monitoring period included passing vehicles, overhead planes, distant traffic and birdsong. Distant vehicle movement onsite was also audible during the monitoring period.
NM4	2011 Nov 15	16:14:56	No	52	44	51	Weather conditions were dry and bright with calm, still wind conditions. Noise sources at this location included 3 passing trains, passing traffic and distant traffic, one plane, one helicopter and birdsong. Some engine sounds and occasional reversing beacons could be heard from the site.
NM5	2011 Nov 15	15:41:29	No	48	40	49	Weather conditions were dry and bright with calm, still wind conditions. Noise sources at this location during the monitoring period included passing vehicles (c. 8 no.), one overhead plane and birdsong. Distant traffic sounds were also audible at this location. Site vehicle movement onsite was also audible at this location.

3.4.2 Assessment of Tonal Components

All measurements were subject to a one-third octave band analysis to identify tonal components within the noise measured. The raw results of this analysis have been presented in the quarterly reports submitted during the reporting period. Tonal noise was identified on a number of occasions and the reported L_{Aeq} was adjusted by 5 dB in accordance with the EPA (2006) *Guidance Note for Noise in Relation to Scheduled Activities, 2nd Edition.*

3.4.3 Interpretation of Results

Noise emission limits are presented in Table 3.9 above. There were only eight instances during the year during noise monitoring periods which complied with the EPA limit of 55 dB (A) for daytime noise.

Traffic movements on Balleally and Rogerstown lane are the main contributors to noise levels in the area, which includes noise from trucks travelling to and from the site. Noise from site does not have as much impact as traffic movements; however a great number of the traffic movements are related to vehicle movements to the site.

The influence of vehicle movements (on the noise results can be seen from the correlation between the L_{Aeq} and the L_{AF10} results. In all cases the L_{Aeg} is closer to the L_{AF10} results than the L_{AF90} results. The L_{AF90} results for all locations are under 55 dB licence limits, while the L_{AF10} results range from 49 to 68 dB(A). This suggests that sound occurring for 10% of the monitoring period, which is greatly influenced by traffic, train, overhead airplane movements (and for this site this would also include bird-scare devices) had a large influence over the final L_{Aeg} levels recorded over the monitoring period and that the background noise, represented by the L_{AF90} is less noisy.

At all locations the LAF90, representing background noise levels, are under the trigger level of 55 dB.

3.5 Dust and PM₁₀ Monitoring

3.5.1 Dust Monitoring

Dust monitoring was carried out at 4 locations in accordance with Schedule D of the licence. The locations of these monitoring points are shown on Figure DE07-164-03-001-(C), Appendix I and presented in Table 3.16

Bergerhoff style gauges were used to determine total dust deposition levels at the site. Four gauges were set up so that the dust jars were at a height of at least 1.5 m above the ground and the jars were set in place during the monthly monitoring events. The samples were submitted to Southern Scientific Ltd. for analysis of total dust contents.

Table 3.14: Dust Monitoring Locations

Location	Easting	Northing
DM1 (PM1)	321 874	252 321
DM2	321 927	252 482
DM3 (PM2)	322 038	252 484
DM4 (PM3)	322 728	252 671

Note = (PM Labels = PM10 monitoring locations)

3.5.2 Monitoring Results

The annual results for total dust deposition are presented in Table 3.15.

J: LW11/164/01/Rpt004-0.doc Page 32 of 75

Table 3.15: Dust Deposition Results (mg/m²/day)

MONTROPING		Aug-11			SEP-11			Ост-11	
Locations	ORGANI C DUST	INORGANI C DUST	TOTAL	ORGANIC	INORGANIC	TOTAL	ORGANIC	I NORGANI C DUST	TOTAL DUST
D1	27	27	54	29	19	48	128	10	138
D2	19	23	45	178	52	230	56	19	48
D3	26	25	09	91	23	40	34	14	48
D4	23	40	63	20	14	34	173	56	229

Page 33 of 75

3.5.3 Interpretation of Results

An organic and inorganic analysis of dust was performed in addition to the total dust deposition analysis to give a greater understanding of the results.

The results indicate that during the monitoring period the all results were under the licence limit of 350 mg/m³/day. D2 and D4 show elevated readings. D2 is located off-site in a field. The laboratory identified a layer of visible brown particles on analysis. Market-gardening type harvesting and re-seeding was taking place in the field during the monitoring period.

3.5.4 PM₁₀ Monitoring

Monitoring of particulate matter (PM_{10}) levels was undertaken once for a 24 hour sampling period at 3 monitoring locations, namely PM1, PM2 and PM3 in accordance with Schedule D of the licence during the 2009 monitoring period. The locations of these monitoring points are shown on Figure DE07-164-03-001-(C), Appendix I and presented in Table 3.18.

3.5.5 Monitoring Results

The PM₁₀ monitoring results for the 2011 monitoring period are presented in Table 3.18.

Table 3.16: PM₁₀ Results 2011

SAMPLING POINT	Average Concentration Value
SAMPLING POINT	(μ G /M³)
PM1	7.8
PM2	17
PM3	13.1

3.5.6 Interpretation of Results

There is no emission limit set for PM_{10} in Schedule C of the licence but Condition 6.7 sets a trigger level of 50 μ g/m3 for a daily sample.

The results in Table 3.18 show that the air quality is good at all sample points and the results are under the trigger level of $50 \,\mu\text{g/m}$ 3 for a daily sample.

3.6 Landfill gas monitoring

3.6.1 <u>Installation of New Landfill Gas Management Infrastructure</u>

15 No. 125mm diameter temporary gas extraction wells were drilled during 2011 across Cells 5 & 6 and the piggybacked area. The areas were selected after careful consultation with the staff at Balleally Landfill, in ascertaining the precise locations, which would reap the most gas based on what waste was landfilled. The spacing of the gas extraction system is approximately 45 m between each well on each line. The depth of each of the extraction wells is no deeper that 2 m above the base of the lined landfill at the point of each gas well. The wells were connected to the utilisation plant. The CQA document for these wells is available for inspection at the facility offices.

The licence requires that the licensee conducts monthly monitoring in the gas boreholes/vents/wells in order to detect off-site gas migration. The location of the monitoring positions is shown on Figure DE07-164-03-001-(C), Appendix I.

J: LW11/164/01/Rpt004-0.doc Page 34 of 75

The locations are presented in Table 3.19. In addition to the perimeter Landfill Gas Monitoring locations two leachate monitoring wells (chosen at random) from each of the southern and eastern boundaries LMW1-LMW18 and two manholes MHL33 and MHL40 (Table 3.20) along Balleally Lane were also monitored. LMW1-LMW18 boreholes are located in front of the vertical barrier installed along these boundaries and are in the leachate that is collected at these points.

It should be noted that boreholes LMW1-18 are leachate sampling wells and not specifically designed for monitoring landfill gas. See Table 3.19, 3.20 and 3.21 for grid references.

Table 3.17: Gas Monitoring Locations

Borehole ID	Borehole Description	Easting	Northing	Depth of Borehole (m)	Top of casing level	Ground Level (m O.D.)	Sample

3.6.2 Monitoring Parameters

In accordance with Table D.2.1 of the Waste Licence, gas wells were monitored for Methane (CH_4) , Carbon dioxide (CO_2) , Oxygen (O^2) and atmospheric pressure. It should be noted that the boreholes along the estuary were designed and constructed to sample leachate and groundwater and not specifically landfill gas.

3.6.3 Monitoring Results

The Landfill Gas (LFG) monitoring results are summarised in Figure 3.12 and Figure 3.13.

3.6.4 Interpretation of Results

 CH_4 results for the 2011 monitoring period were generally below the 1% trigger level (Figure 3.13). However, results elevated above the trigger level at locations GA3 and GA5 and also at GA13 are noted. These locations are situated along the north and north-eastern corners of the landfill.

The levels of CH_4 recorded at GA5 were high in the first quarter with drop off in methane for quarter 2. There was a peak in Ch4 levels in July in quarter 3 while quarter 4 Ch4 levels were recorded as elevated.

Occasional CO_2 results elevated above the 1.5% trigger level at sampling locations GA3, GA4, GA5, GA7, GA11 and GA13 through 2011 (Figure 3.15). CO_2 levels illustrate a similar trend to the results found last year. High concentrations of CO_2 can occur naturally at shallow depths of up to 2 m due to microbial activity associated with the roots of many types of vegetation.

No CH₄ was recorded above the trigger levels at gas wells adjacent to offsite receptors, GA10 or GA 11 during the reporting period.

3.6.5 Conclusion

In general, gas levels appear to be at their highest values during the first and fourth quarters of the monitoring period. .

During the monitoring period FCC took the proactive approach of monitoring LFG at on-site and off-site locations weekly and they are also monitoring GA5 more frequently. The results of this additional monitoring are retained by FCC on-site and any changes in the trends will be noted. This monitoring is in addition to the licence compliance monitoring being undertaken by FTC.

Additionally FCC are working with Bioverda who manage the landfill gas on-site to effectively balance the gas field and reduce the levels of methane noted in GA5. A number of additional in-waste landfill gas extraction wells have been drilled in the landfill body during the reporting period and have become operational in order to increase the LFG abstraction for energy from the area of the landfill adjacent to GA5.

3.6.6 Summary report on emissions

As per Schedule D.7.1 of Waste Licence W0009-03 the licensee is required to carry out annual environmental monitoring of the Gas Combustion Plant/Enclosed Flare. Odour monitoring Ireland personnel conducted the survey on the 9th December 2011.

The monitoring included the gas composition in the flue outlets from the four generators and flare in order to meet the requirements of the waste licence. The monitoring for CO, SO_2 , NO_x , and O_2 was carried out *insitu* using an electrochemical analyser. Temperature, velocity and flow rate were also monitored *in-situ* using a thermocouple and a pilot tube and manometer respectively. Samples were collected for analysis to determine TA Luft Class I, II, III organic substances. In addition, samples were collected for the landfill gas delivery system and determined for chlorine, fluorine and sulphur content.

The compliance status of emissions from the three generators with respect to the Waste Licence Limit is summarised in Table 3.20.

 ${
m NO_x}$ as ${
m NO_2}$, particulates, Total Non Methane Volatile Organic Compounds, Hydrochloric acid and Hydrogen fluoride were low in the gas utilisation engines and within Emission Limit Values set out in Schedule C.5 of the Waste Licence.

CO emission concentration values were above the 650 mg/Nm³ Emission Limit Value established for Waste Licence W0009-02 at BY02, 03 & 03. These gas utilisation engines were below the Emission Limit Value (1400mg/m³) set for Carbon monoxide in other licences, e.g. W0127-01.

3.7 Meteorological Monitoring

Condition 8 and Schedule D.6 of Waste Licence W0009-03 require daily monitoring of precipitation volume, temperature (max. /min.), wind force and direction, and atmospheric pressure.

June and July had the highest maximum mean monthly temperatures. Monthly Rainfall was highest during September and November when highest volumes of rainfall were registered. The site was predominantly affected by south westerly winds. Evaporation and potential evapotranspiration were highest in June and July.

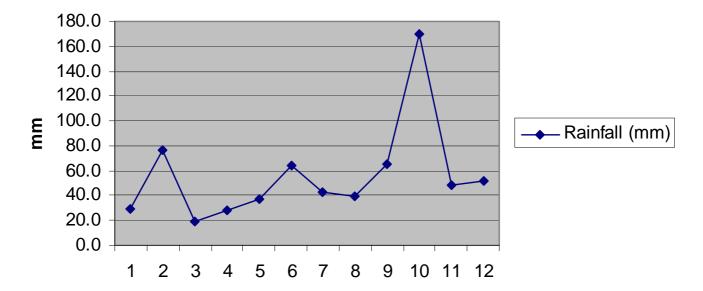

Figure 3.16: Total Precipitation Volume by Month, 2011

3.8 Resource Consumption

Resources consumed at Balleally Landfill include diesel fuel, electricity, hydraulic oil and lubricating oil. Table 3.25 presents a summary of the quantities of each used on-site for the period of this report. Electricity consumed on-site (Table 3.26) was used for the purpose of heating, lighting, the operation of office equipment and the leachate treatment plant. The largest consumer of electricity was the leachate treatment plant until it was decommissioned during 2009. There was a sustained and significant drop in energy usage since 2008 peak.

Diesel consumption in 2011 was down on 2010 reflecting the fact that a number of items of plant transferred to other depots.

Water Consumption in 2011 was significantly lower in 2011 than 2010; this was due to a different wheelwash system brought into use during 2011.

J: LW11/164/01/Rpt004-0.doc Page 45 of 75

Table 3.21: Summary of resources used On-site 2011

Resource	FCC	BPS
Electricity	64,209KWh	1,924 KWh
Diesel	175,877 litres	0 litres
Petrol	9,454 litres	0 litres
Lube Oil	1000 litres (Estimate)	23,610 litres
Water	3273 m3	

Table 3.22: Electricity consumption on-site for January - December 2000 - 2011

Year	Site 900109623	Site 901532286	Leachate Treatment Plant 902446909	KWHr Total
2011	Ceased	59,100*	5,109*	64,209*
2010	Ceased	71,575*	6,460*	78,035*
2009	Ceased	82,950*	101,367*	184,317*
2008	1,832*	91,350*	202,739*	295,921*
2007	1,726*	84,900*	202,669*	289,295*

2005	1,033*	115,050*	N/R	115,050*
2004	NR	66,250*	N/R	66,250*
2003	NR	NR	N/R	89,155 @
2002	NR	NR	N/R	76,529 @
2001	NR	NR	N/R	55,453 @
2000	NR	NR	N/R	49,016 @

^{*} Data derived from ESB Energy Extra Website for three accounts registered to Balleally. N/R: Accounts not set up at these times. @ Data sourced from AER 2006.

Note:

- 1) There was a significant increase in electricity consumption in the period 2006 2008, from previous years as can be observed from Table 3.22. This is attributable to the operation of the new on-site leachate treatment plant. The decrease in 2009 is attributable to the fact the leachate treatment plant was not in operation. The leachate treatment plant remained closed during 2011.
- 2) With the exception of 2004, electricity consumption has increased consecutively from the year 2000 to 2008. Since 2009 electricity consumption decreased and continued to decrease through 2011. In 2011 the decrease may in part be due to milder winter (less heating), direr conditions (less pumping) and the move from an automated to manual wheel wash.

3.8.1 Resource Use and Energy Efficiency Audit

On 28th October, 2005 the EPA issued a technical amendment (B) inserting a new Condition 2.5. This condition requires FCC to carry out an energy efficiency audit. The audit must:

- i) identify all opportunities for energy use reduction and efficiency;
- ii) be carried out in accordance with the guidance published by the EPA "Guidance Note on Energy Efficiency Auditing", and
- iii) be repeated at intervals required by the Agency.

The recommendations from this audit should be incorporated in the Schedule of Environmental Objectives and Targets under Condition 2.3. Opportunities for reducing water consumption and identifying recycling and reuse initiatives will be investigated and an assessment of the efficiency of use of raw materials in all processes will be carried out.

3.8.2 Energy Efficiency Audit

The best practice Specific Energy Consumption (SEC) sometimes called the Energy Performance Indicator (EPI), of the sector and of any significant processes is determined where possible. The site SEC's are then compared to the best and the average practice. Any discrepancies were investigated during the 2006 energy audit.

The energy audit identified the site SEC. This may be used as a benchmark to identify the success or otherwise of the implementation of the recommendations.

3.8.3 Implication of Audit Findings

No SEC data could be found for comparable industry sectors and thus no comparison of the site's SEC with others could be made.

The energy audit identified a number of recommendations that could be implemented. Implementation of these will result in a reduction of energy cost and green house gas emissions. However in comparison to other industrial sites the energy consumed at Balleally Landfill is very low, especially when it is considered that Fingal County Council do not directly control the diesel used by the hired heavy plant vehicles. As the energy consumption at Balleally is so low, it is proposed that it may not be necessary for FCC to have further energy audits conducted at the site.

3.9 Landfill Gas Utilisation

Landfill gas is actively extracted by means of a series of wells and a collection pipe network in the waste body. The gas is pumped through two main lines to the site utilisation plant. The utilisation plant comprises of three generators grouped into two operating units AER1 and AER3 as shown in the schematic diagram of the plant in Appendix I.

J: LW11/164/01/Rpt004-0.doc Page 48 of 75

To achieve maximum design power output from the station the inlet gas must contain 50% methane and the minimum available gas volume must be $3,340 \text{ m}^3/\text{hr}$. At present the 50% methane gas concentration is achieved, but the gas volume is not measured at the landfill.

The power station/utilisation plant operators, Bioverda Power Systems Limited, regulate the inflow of gas to the station in order to achieve the 50% Methane target. The total power output from the station for the period is shown in Tables 3.23 & 3.24.

Currently sufficient gas is being extracted to run 3 engines.

Table 3.24: Electricity Output (MWhr) from the On-site Power Station at Balleally Landfill per year 2003-2011

YEAR	ELECTRICITY OUTPUT (MWhr)
2003	30,194

3.10 Review of Nuisance Controls

Condition 7 of Waste Licence W0009-03 requires that vermin, birds, flies, mud, dust, litter and odours do not give rise to nuisance at the facility or in the immediate area of the facility. To this end a review of the nuisance controls was initiated.

The nuisance which gave rise to greatest number of complaints up to 2008 was odour when fourteen such complaints were recorded. However, these complaints are significantly down since then and only one odour complaint was recorded in 2011.

All complaints were responded to as soon as possible after the time they were reported. Odour monitoring Ireland visited the site twice during 2008 and once during 2009 and they made many recommendations for odour / surface emission control (EPA Refs. W0009-02/gen43mh & W0009-02 / ak60em). Many of these recommendations have been implemented to date in an effort to further improve odour control and may have contributed to the reduction in odour complaints.

Where these complaints or weekly nuisance inspections reveal odours associated with landfill activities landfill management take corrective action. Expert advice was sought previously on the installation of effective odour control. Mist-Air, based in the United Kingdom were retained.

Mist Air odour neutraliser is an alternative gas cleaning technology that achieves the transfer from odorous gases to a non-odorous liquid. This is achieved by mixing the contaminated air efficiently with the absorbent mist at the optimum ratio of volume to surface area causing a rapid transfer of the odorous gases into the liquid phase, thereby preventing a smell. The neutraliser is totally biodegradable, together with the many odorous causing pollutants and is safe for animals, humans and plants life. It absorbs Ammonia, Alcohol's, Hydrogen Sulphides, Sulphur Dioxide, Ethyl Mercaptans, Amines and many more gases.

The misting system is a base unit housed in a free-standing lockable steel cabinet that provides all the power for the system. A reinforced circulation hose is then fed from the base unit to the various circuits required from around the site.

The static manifolds are fitted with stainless steel atomising jets. These are mounted around the site at 7 meter centres. The system is currently installed around the active Cell 5. The static manifolds were attached to their own independent poles during late 2005. This is a change in practice based on the idea that if they have their own fixed position then they do not have to be continually moved with the litter netting as the active cell changes levels as filling progresses. This should mean less maintenance and air blocks, which will improve the effectiveness of the system's performance.

Since the construction of the speed ramps along Balleally Lane, there has been an increase in the amount of mud deposited on the road. FCC reviewed the road-sweeping programme and had a few trial runs with a footpath-cleansing vehicle and various road sweepers. FCC send a road sweeper up Balleally Lane daily which sweeps Balleally Lane and the within the Landfill from exit point to wheelwash. Additionally FCC have a tractor mounted sweeper on loan which is used on site and at site entrance/exit.

3.10.1 Review of Bird Control January to December 2011

Bird Control Ireland Ltd visited Balleally Landfill site for the purpose of Bird Control between January 2011 and December 2011.

During this time site was visited once/twice per month on some occasions and a jointly operated programme was run. The objective of the programme at Balleally was to reduce the amount of scavenging birds on-site to a minimum.

During each visit to site Bird Control Ireland staff undertook efforts to reinforce the daily bird control activities. These included:

- Flying of Falcons and Hawks
- Use of species specific distress calls
- Use of shotgun and Bird scaring pistol
- Flying of various kites (visual deterrents)

J: LW11/164/01/Rpt004-0.doc Page 50 of 75

Jeremy Nicholson met with site manager on 9th May and discussed the programme.

Common Gull, Rook and Jackdaw are the most common bird on site throughout 2011. These pest birds were moved off site with distress calls and visual deterrents. No gulls were harmed.

Two bird control Hawk Kites were set up at a lower location other than the top of the site on the 20th October.

• Hard and cold weather in January 2011 showed increased numbers of scavenging birds on site. Birds were not permitted to land and were pushed off on each occasion.

Throughout the year Bird Control Ireland Ltd undertook management activities

- Liaison with site management
- Variation of bird control activities on-site to achieve best results
- Equipment maintenance and report faults etc.
- Maintenance of site bird control manual and visit log

The Balleally project has achieved a measure of success for a low level programme. Using site equipment birds can be moved on easily.

In conclusion:

- Birds did attempt raids each month but were cleared using the range of techniques and equipment available.
- Corvids and Gulls are the most persistent bird that attempt to raid Balleally Landfill on occasions, usually during times of inclement weather.

Bird Control Ireland Ltd are pleased with the results achieved at Balleally Landfill Site during 2011 and this level of control is to be expected to remain as the current programme continues.

J: LW11/164/01/Rpt004-0.doc Page 51 of 75

Section 4

Site Development Works

4. SITE DEVELOPMENT WORKS

4.1 Works carried out during the Reporting period, 2011

The ongoing capping programme and final restoration of the landfill will control and contain the breakouts which occasionally occur near the entrance. The shallow vertical barrier surrounding the facility will be completed at the entrance as part of the closure plan. This should help contain any contamination of surface water with leachate into the future.

4.1.1 Installation of New Landfill Gas Management Infrastructure

10 No. 125mm diameter temporary gas extraction wells were drilled during 2010 across Cells 5 & 6. The areas were selected after careful consultation with the staff at Balleally Landfill, in ascertaining the precise locations, which would reap the most gas based on what waste was landfilled. The spacing of the gas extraction system is approximately 45 m between each well on each line. The depth of each of the extraction wells is no deeper that 2 m above the base of the lined landfill at the point of each gas well. The wells were connected to the utilisation plant. The CQA document for these wells is available for inspection at the facility offices.

Table 4.1: Work carried out during 2011

Objective/ Target	Description	Timescale
Objective 1	To minimise environmental impact on the immediate environment	
Target 1	Repair or replace leachate monitoring boreholes around landfill perimeter.	Complete.
Target 2	To remediate banks around existing and new boreholes and up update TOC readings. Some TOCs resurveyed and to be relabelled in situ.	Ongoing.
Target 3	To review and extend gas abstraction network in newly capped areas. Significant new areas harnessed 15 new auger wells piggybacked area and cells 5&6.	Ongoing
Objective 2	Complete capping of phase 12 and 8. Phase 12, Cell 6 mostly capped. Phase 8 largely capped. Piggybacked area Phase 1 and part of phase 2 capped,	Ongoing.
Target 1	Restoration of the facility.	
Target 2	Prepare Landscaping Plan for implementation in 2009-2011 to include planting of northern boundary adjacent to gas plant area, Balleally Lane / Landfill northern boundary (after final capping installed) and capped southern and eastern boundaries up to 27m contour line. Grass seeding of capped areas ongoing	Ongoing

J: LW11/164/01/Rpt004-0.doc Page 53 of 75

Objective/ Target	Description	Timescale
Target 3	Examine the completion of a shallow vertical barrier at the northern boundary for implementation during restoration of site. No Progress to report.	Ongoing
Target 4	To provide for Leachate Recirculation in Cells 5 & 6 and Piggybacked area.	Ongoing.

Table 4.2: Works to be carried out during 2012

Objective/ Target	Description	Timescale
Objective 1	To minimise environmental impact on the immediate environment	
Target 1	To review and extend gas abstraction network during 2012 in recently capped areas of new cells (5-6) & Second Lift Piggybacking.	Feb-Dec 2012.
Target 2	To provide for Leachate Recirculation in Cells 5 & 6.	Feb-Dec 2012.
Target 3	Complete Licence Review / Technical Amendment for leachate treatment plant	Feb-Sept 2012.
Target 4	To prepare final conours, capping and surface water plan for former Civic Amenity Area, offices and entrance area.	Ongoing.
Target 5	To complete mitigation measures to deal with surface water contamination at SW20a.	March-Dec 2012.
Target 6	To continue to investigate mitigation measures for the prevention of leachate breakout along the southern boundary of the landfill.	Jan – Dec 2012.
Target 7	To investigate sources of SW contamination in landfill and propose mitigation measures to The Agency	Jan – Dec 2012.
Objective 2	Restoration of the facility.	
Target 1	Examine the completion of a shallow vertical barrier at the northern boundary for implementation during restoration of site.	Jan – Dec 2012.
Target 2	To Prepare Plan for the demobilisation of existing facility offices to a new location.	Jan – Dec 2012.
Target 3	Address Flooding Issue at Entrance.	Jan – Dec 2012.
Target 4	Leachate Monitoring Levels SCADA system and LTP PLC integration	Jan – Dec 2012.

J: LW11/164/01/Rpt004-0.doc Page 54 of 75

4.2 Progress on-site restoration

The Restoration and Aftercare Plan for the landfill was submitted in July 2003 as per condition 4.1. This plan sets out a framework to successfully restore Balleally Landfill to a condition suitable for use as an amenity for the general public. The plan has been prepared in accordance with the EPA Landfill manual 'Landfill Restoration and Aftercare' (1999), the Council Directive (1999/31/EC) on the Landfill of Waste and Waste Licence W0009-02 & -03. Restoration is being undertaken at Balleally Landfill using a phased approach due to the size of the site and seasonal constraints. On completion of restoration in each phase, the aftercare plan to establish and maintain the after use of the site shall be implemented.

Capping of the site is as per Condition 4.3. The geotextile alternative was investigated and agreed in early 2004 with the EPA. This decreased the number of vehicle movements required for importing soil for the final cap.

Figure 3, Appendix 1, indicates the agreed phases for the capping and restoration of Balleally Landfill. The phasing provides for the restoration of the original landfill initially, and then the landfill extension area.

The total area for capping is 46 Hectares approx.

Between 2004 and December 2010, 36.75 Hectares were capped. During 201, an additional 3.25 Hectares (1.4 LLDPE / .45 GCL) were capped. Which means that, along with the majority "Old Landfill", Cells 1, 2, 3, 4 and the majority of 5 and some of cell 6 of the new landfill, are now capped, see Figure 4 Appendix 1. A total of 40 Hectares is now capped. This equates to 87% of the entire landfill area to be capped. The remaining capping areas are the new cells 5&6 (0.25ha approx.), Piggybacking (2ha) and Old Landfill (4ha approx).

A proposal was sent to The Agency (Ref: FCC-W0009-02-020) on 22/9/2008 to provide for a second lift "piggybacking" between "new cells" and Top Lobe of the old landfill. This proposal would give a void space of 176,000 tonnes. This proposal was agreed to, subject to conditions, by The Agency, (Ref: W0009-02 / ak61em) and an additional 1.6ha of the landfill was lined for the reception of waste.

4.2.1 Inert waste to be used for cover/restoration material at the facility

An estimate of soils required for the final capping of the landfill is as follows:

Expected subsoil tonnages for restoration = 1,180,000 tonnes Expected topsoil tonnages for restoration = 580,000 tonnes

This estimate does not take into account any soil requirements for levelling off the contours prior to the placement of the final capping. However, it is expected that material on the landfill site (berms etc.) will be used which will limit the importation of soil/clay.

Onion skin method of filling takes place at the tipface at Balleally Landfill as described in the EPA Landfill Operational Practices manual. As a result of this method at the end of each day the tipface is completely covered with clay and other such inert material. This reduces the possibility of windblown litter and provides reasonable surface quality for vehicle access the next day for tipping.

This mixed cover material provides drainage, shape and surface stability to the landfill, which is essential, when the final restoration measures above are initiated.

A filling plan has been prepared for the extension area in 2006 to ensure the integration of waste filling activities with the phased restoration of the site under condition 5.2 of the Waste Licence W0009-02.

A revised filling plan was submitted to and approved by the EPA before entering Cell 5; the revised plan took into consideration the EPA Circular Letter to all landfills, dated 20th June 2007.

The total area of the site is 124 Acres. The Licence area is 124 Acres (50.18Hectares). The total area for capping is 46 Hectares.

J: LW11/164/01/Rpt004-0.doc Page 55 of 75

See below statistics of capping programmed:

Start Date of Capping Programme: May 2004

Progress as of 31st December 2011: 40 ha

The final capping profile is made up of:

- 1. Topsoil layer of 300 mm thickness.

- Subsoil layer of 700 mm thickness.
 Geocomposite Drainage Layer (GDL).
 Geosynthetic Clay Liner (GCL) / LLDPE membrane liner on New Cells.
 Geocomposite Gas Collection (GGCL).

See Appendix I, Figure 4 indicating the areas capped to 2011 and the proposed areas to 2012.

4.3 Annual topographic survey

In accordance with Condition 8.5.1 of WL W0009-03 a Topographical Survey was undertaken in Balleally Landfill in December 20011 and submitted to The Agency 9/12/2011 (Ref: FCC-W0009-03-2010-018).

4.4 Slope stability

As required under Licence Condition 8.8.1. a slope stability survey was undertaken in Balleally Landfill during December 2011 and will be submitted to The Agency shortly.

J: LW11/164/01/Rpt004-0.doc Page 56 of 75

Section 5

Waste Received & Consigned from the Facility

5. WASTE RECEIVED & CONSIGNED FROM THE FACILITY

5.1 Waste acceptance and handling

5.1.1 Waste reception

During operational hours, a qualified person in charge of the landfill is always present on-site. A weighbridge system was installed at Balleally Landfill by Precia Molen Irl. Limited. It originally consisted of two Precia Molen VS300CS surface Mounted Weighbridges linked to a GeneSYS PC-based Weighbridge Management System. The GeneSYS Windows – based software, which forms the basis of the PC based system stores all relevant data in database form from which cross-referenced reports can be generated as required by landfill management and the accounts department.

The system has been in operation since the 25^{th} of May 2005 and consists of two weighbridges, one "in" and one "out". These are linked to a computerised system. The capacity of both weighbridges is 50,000/60,000Kg and the deck size is $18m \times 3.6m$. The weighbridge system is operating on one weighbridge from Q3 2011.

Extensive protection against lightening is included as standard, this includes earthing bonds for each loadcell and a central earth for the entire weighbridge.

Records of loads arriving on site are recorded as per Condition 10.2 (i) of the Waste Licence W0009-03 detailing the date and type of waste rejected and the facility to which they were directed. These include the date, weight (tonnes), origin (producer/collector), description of waste (EWC code), the carriers name, vehicle registration and special handling/pre-approval permit number (where applicable) is recorded. The initial point of inspection is the weighbridge and the name of the operator is recorded electronically by the GeneSYS system as the person checking the load in the first instance. Written operational procedures for waste acceptance are available and used for training staff on-site.

The weighbridge is located a few hundreds yards north of the administration building where a service hatch permits communication with the driver and inspection of documentation accompanying the waste consignment (Waste Acceptance Form A, B or C, Permit (if applicable). The site reception area is laid out in a one-way system, which assists the through flow of vehicles. No vehicles deemed unfit to use the site roads are allowed access.

All vehicles arriving on-site must be appropriately covered to ensure the transport of the waste does not adversely affect the environment. Warnings will be given to the driver where necessary and if the instruction is ignored the company involved will be contacted and the load rejected.

Acceptance of waste is as per Schedule A of the Waste Licence Reg. No. W0009-03 Waste Acceptance policy agreed by EPA as per condition 1.6 and condition 5.2.3 of the licence.

Wastes not acceptable are liquid wastes, animal wastes, construction and demolition wastes, whole used tyres and hazardous wastes. Difficult wastes that require special handling can only be accepted if the Environmental Services Department of the Council has given prior authorisation at County Hall, Swords. Authorisation is by means of a valid permit (which expires one month after the date of stamping by the Environmental Services Department) and details the waste type, quantity and any special instructions required by site personnel.

Following acceptance of the load the weighbridge operator directs traffic to the relevant working area for the waste type where a banksman in charge of traffic will give further instructions to drivers.

5.1.2 Waste inspection

If the weighbridge operator is unhappy with the documentation, nature and/or source of a load presented for disposal or if the carrier's permit is invalid, he will contact the Site Manager and may instruct the vehicle to park (in a holding area) while the legal status of the permit, or the origin, description and nature of the load is confirmed.

J: LW11/164/01/Rpt004-0.doc Page 60 of 75

Balleally Landfill, W0009-03 Annual Environmental Report - 2011

A visual inspection can be performed at the weighbridge, if possible. Alternatively, the load can be tipped adjacent to the relevant tipping face and inspected by the designated waste inspector. Where a breach of the law is suspected, the EPA and the Gardaí will be informed.

Where a breach of the waste acceptance policy is suspected the load can be diverted to the Waste Inspection Area/Quarantine Area for further inspection.

In addition to these inspections, checking and confirmation of suspect loads, random checks are also carried out on regular site traffic.

Non-municipal type waste is not accepted on site unless the Environmental Services Department has given prior approval at County Hall, Swords by means of a pre-approval permit.

FCC personnel responsible for checking the documentation accompanying vehicles must be capable of:

- understanding the waste acceptance criteria for the site in terms of licence requirements, and site management policies,
- understanding the basic underlying reasons for the acceptance criteria for the site,
- understanding the information which should be provided on the documentation accompanying loads,
- identifying non-conformity,
- Following specific procedures in the event that either the documentation is incorrect or the load does not comply with the relevant acceptance criteria.

Where inspection of a load is not possible at the site reception area (e.g. sealed containers), then the waste is deposited on the ground close to the working face. This permits inspection of the load prior to blading and burial. If a non conformity is discovered or suspected, the waste is isolated and placed back in the transporting container or suitable alternative and removed to the Quarantine area pending management investigation. If the non-compliance is confirmed and deposit on the site not possible, then the load is returned to the carrier, and the producer and authorities informed. Written records of the incident are recorded at the Weighbridge in the Rejects Book. Loads held on-site overnight are recorded in the Quarantine Register.

5.1.3 Inspection/Quarantine Area

An inspection area is provided as per condition 3.7 of the Waste Licence Reg. No. W0009-03. Any waste not conforming with schedule A and/or agreed Waste Acceptance Policy as per condition 5.1-5.5 & 1.6. will be rejected and removed off-site or placed in the quarantine area. Suspect loads will be diverted to the Inspection area for spot checks.

Waste received at Balleally to be disposed of at the landfill is weighed at the weighbridge on entry. A waste acceptance policy has been prepared as per Condition 5.1-5.5. This enables the recording of waste into and out of the facility as per Condition 10.2.

J: LW11/164/01/Rpt004-0.doc Page 61 of 75

Quantity & Type of Waste Deposited in Balleally Landfill in 2003-2011 & Waste Licence Limit for Waste Licence W0009-03 **Table 5.1:**

Waste	Licence Limit (tonnes)	Deposited in 2003 (tonnes)	Deposited in 2004 (tonnes)	Deposited in 2005 (tonnes)	Deposited in 2006 (tonnes)	Deposited in 2007 (tonnes)	Deposited in 2008 (tonnes)	Deposited in 2009 (tonnes)	Deposited in 2010 (tonnes)	Deposited in 2011 (tonnes)
Household	152,500	61,201.52	65,814.99 (+ 6,099.56 C.A) 71,914.55	66,203 (+ 5,801 C.A) 72,004	62056 (+4,891 C.A.) 66,947	63,708 (+4,867 C.A.) +62 F.T. 68,637	50,489 (+ 3,959 C.A.) +10 F.T. 54,458	37,789	30,769.86	24,007.39
Commercial	200,000	150,454.96	119,890.35	49,195.57	63,819	61,773	46,248	54,093	56,866.74	60,579.04

Industrial Non- Hazardous Sludge	000'9	5,749	5,992.8	9'935	6,825	7,061	099'9	898'9	069'9	6967.42
Total	388,500	221,899.48	202,902.28	131,236.81	142,214	144,937	112,457	099'86	94,687.44	91,834.47

C.A - Civic Amenity

As can be seen from the above figures during 2005-2011, the industrial non-hazardous sludge from Leixlip waste water treatment plant exceeded the licence limit of 6,000 tonnes. This is attributable to the expansion of the plant due to an increase in demand for potable water and subsequently an increase in production. Tonnages of Sewage sludge have dropped off considerably from 2008-Present. Note:

5.2 Quarantine Register

Vehicles are taken into quarantine at Balleally Landfill for inspection under the Operation Bruscar Scheme.

5.2.1 Operation Bruscar Introduction:

On Saturday, 16th November 2002 a joint operation between guards and authorised persons under the Waste Management Act, 1996 commenced. This operation was codenamed "Operation Bruscar".

The authorised persons involved identified vehicles that were transporting waste and requested the guard to stop the identified vehicle. The waste on the vehicle was examined and the driver was questioned with regards to the origin and eventual destination of the waste. If, in the opinion of the authorised person, it was necessary to prevent environmental pollution, the vehicle containing the waste was impounded.

All impounded vehicles were taken to the quarantine area at Balleally landfill, where they were detained. This made it possible to further inspect and in detail examine the waste on the impounded vehicles.

Examination of waste is necessary to gather evidence for possible prosecution and to classify and identify the waste to safely dispose of it at a facility that is licensed to accept it.

Three operations were done during November and December 2002 and 41 were executed in 2003. 39 of these vehicles have been impounded to date, 25 of them in 2003.

There were only 7 vehicles impounded in 2004 and 3 vehicles impounded during the reporting period of 2005. This was owing to the temporary closure of the quarantine area in order to facilitate the excavation of the new cell number 6 in July 2004. A replacement quarantine area was built in 2005 but utilisation of this area has not been possible due to outstanding construction issues. All vehicles impounded are recorded in the Balleally Landfill Quarantine Register. Fingal County Council has also agreed to accept vehicles from similar operations from Meath County Council waste officials when required.

2006

There were seven vehicles impounded in the quarantine area during 2006. All vehicles impounded are recorded in the Balleally Landfill Quarantine Register. FCC has also agreed to accept vehicles from similar operations from Meath County Council waste officials when required.

2007

There were six vehicles impounded in the quarantine area during 2007. All vehicles impounded are recorded in the Balleally Landfill Quarantine Register. FCC has also agreed to accept vehicles from similar operations from Meath County Council waste officials when required.

2008

No vehicles were impounded in the quarantine area during 2008.

2009

No vehicles were impounded in the quarantine area during 2009.

2010

No vehicles were impounded in the quarantine area during 2010.

2011

No vehicles were impounded in the quarantine area during 2011.

5.3 Discussion of Fingal County Council's waste consigned to Balleally Landfill

- **Domestic Waste:** Domestic waste is household refuse that was collected by FCC refuse freighters from the doorstep of private households. The waste is presented to the Council in a wheelie bin.
- **Road Sweepers:** Road sweepers are lorry type machines that are employed by the Council to sweep channels and kerbing and to remove grit and litter from the road surface.
- **Roads:** The Roads Department carry out repairs to footpaths and roads in the county. The waste material arising from these activities is used in the landfill for berk and internal road construction.
- Parks: The Parks Department not only tend to trees, shrubs and plants but also conduct repairs to buildings and structures of a historical nature and clear litter and rubbish from open spaces. Residual materials from these activities were deposited to the landfill. Waste from road cleansing and landscaping also arise from this department. It should be noted that no green waste was disposed of to the facility by this department.
- **Drainage:** Sewage sludge consigned to the facility for the period was classified as drainage as it originated in the Drainage Department. This was the only sewage sludge consigned to the facility. This has dropped off considerably in recent years and is mostly confined to sewage screenings.
- **Environment:** Material from the Environment Department originates from activities such as beach cleaning, cemetery management and clean-ups.
- **Cleansing:** The Litter Management Section collects material such as litter bin contents and fly-tipped waste which is consigned to the landfill.
- **Leixlip Waterworks:** Leixlip Waterworks is a potable water treatment plant. A by-product of the treatment process is a non-hazardous sludge cake as well as some screenings. This material ceased coming to Balleally during Q4, 2011.
- **Waterworks:** Waste generated by the operation of the Water and Drainage Division that would include cleanings and inert material arising from the laying of pipes.
- **HQ**: A small quantity of waste produced in the headquarters of FCC was disposed of at the facility.

6.2 Complaints Summary

A summary of complaints for the reporting period is shown in Table 6.2. The complaints register is available for further inspection at the site office. There were a total of 5 complaints received at the facility for the reporting period-compared, an increase of three on 2010. Two related to mud on Balleally Lane and Rogerstown Lane, two related to odour Balleally Lane and Lusk, while one related to litter on a lane off Balleally Lane. All complaints were responded to as soon as possible after the time they were reported.

J: LW11/164/01/Rpt004-0.doc Page 67 of 75

Odour monitoring Ireland visited the site twice during 2008 and once during 2009 & 2010 and made many recommendations for odour / surface emission control (EPA Refs. W0009-02/gen43mh & W0009-02 / ak60em). Many of these recommendations have been implemented to date which may account for the reduction in the number of odour complaints received over the last number of years.

Table 6.2: Complaints received for the reporting period 2011

Date of Complaint	Nature of Complaint	Complaint	Corrective Action
18/1/2011	Mud	Resident complained that truck shed some of it's load of soil and stones along Rogerstown Lane	Balleally Landfill Staff deployed to clean lane. Haulier told not to use Rogerstown Lane for access to Balleally Landfill.
25/1/2011	Mud	Resident complained that there was mud along Balleally Lane	Fingal County Council Staff deployed to clean up lane.
25/1/2011	Litter	Resident complained that there was litter on a lane off Balleally Lane.	Balleally Landfill Staff deployed to pick litter along lane.
14/11/2011	Odour	Resident complained of Odour at Dwelling – Balleally Lane.	Investigation
17/11/2011	Odour	Resident complained of Odour at Dwelling – Lusk.	Investigation

More details are available on the Landfill Managers Complaint Register.

Section 7

Environmental Management Program

7. ENVIRONMENTAL MANAGEMENT PROGRAM

7.1 Environmental Objectives and Targets for 2011

See section 4.2 for environmental objectives and targets.

7.2 Summary of Written Procedures

There were no new written procedures during the reporting period. The waste acceptance forms were revised to allow for the recording of pre-treatment applied to and biodegradable content of wastes consigned to Balleally.

7.3 Communications program for public information

The Communications Programme for Fingal County Council contains information on Balleally Landfill. The information can roughly be divided into two areas. Background information prior to granting of waste licence, and information concerning the waste licence (W009-02 & 03). There is also a register of correspondence to and from the Agency, along with the various correspondences relevant to the Licence. This information is updated on a continuous basis.

Environmental Information can be viewed at the following locations:

- At the Council's Headquarters between 9.30 a.m. and 12.45 p.m. and 2.00 p.m. and 4.00 p.m. Monday to Friday (excluding public holidays), unless otherwise arranged by prior appointment.
- Permanent facilities for viewing information including a computer to be provided at Balleally Landfill.
- At Balleally Landfill by prior appointment with the Landfill Manager.
- A register of information will be made available on www.fingalcoco.ie A Link to the EPA's website will
 also be added to the site.

7.3.1 Site Visits

- Site visits to Balleally Landfill_can be arranged by writing to the Landfill Manager requesting the date
 and time of the proposed visit and indicating the number of visitors and the purpose of such a visit and
 whether any presentation is required. The use of cameras and video equipment during the visit must
 be agreed in advance with FCC.
- Such requests will be accommodated where possible.

7.3.2 Balleally Landfill Liaison Committee

- Information relating to the restoration and aftercare of Balleally Landfill is presented to the Liaison Committee for comment and adoption.
- Members of the committee are:

Mr. John Barrett, Mr Frank Ruigrok and Ms. Catherine Condrot - Balleally Residents and Farmers Association.

Chairperson of Rush Community Council informed BLLC that Charlie Monks had been appointed as representative for Rush Community Council.

Cllr. May McKeon (Chairperson), Cllr. Anne Devitt, Cllr Ken Farrell and Cllr. Gerry McGuire.

Mr. John Daly, Ms. Linda Lally, Mr. Hans Visser, Mr. David Devine and Mr. Mortimer Loftus. - Fingal County Council.

J: LW11/164/01/Rpt004-0.doc Page 70 of 75

The Committee met six times during 2011. Agenda were set and minutes kept. An Annual report of the committee's activities during 2010 was presented through The Balbriggan Swords Area Committee meeting during 2011.

7.4 Financial Provision

Condition 12.2 of the licence requires the establishment of a fund to implement the Restoration and Aftercare Plan (submitted as per Condition 4.1 in July 2003).

Details of Financial Provision were furnished to The Agency on 25/1/2010 in correspondence Ref: FCC-W0009-02-2010-03 & amended on 11/6/2010 in correspondence Ref: FCC-W0009-02-2010-14. A Section 53A workshop on 1st March 2012 being organised by The Agency, shall be attended by officials from Fingal County Council.

7.5 Management Structure

The facility is owned and operated by Fingal County Council. The Environmental Services Department of Fingal County Council manage the landfill facility. Some changes in the management structure occurred during 2011. A description of the current management structure is detailed in Table 7.2.

Table 7.2: Balleally Landfill (Waste Licence W0009-03, Condition 2.2.1) Management Structure, 2011

TITLE	NAME	BASE	DUTIES AND RESPONSIBILITIES	QUALIFICATIONS	EXPERIENCE
Senior Engineer, Environment	Mr. J. Daly	ΗQ	Responsible for Waste Management Enforcement and Waste Infrastructure.	B.E. (Civil Engineering), 1986. M.Sc. Environmental Engineering, 1993. MIEI.	15 years Water Service and Waste Management experience. 14 years LA experience.
Senior Executive Engineer, Environment	Mr. M. Kiely	НΩ	Responsible for Waste Infrastructure within the Environment Department.	B.E. (Civil Engineering) 1977, F.Á.S. Waste Management Training Course.	Approx.30 years LA experience including 18 years Waste Management experience. Joined the Environmental Services Department of FCC in Jul 2001.
Landfill Management, Executive Engineer,	Ms Linda Lally	HQ & Balleally Landfill	Landfill Management. Supervision of external contracts. Liaison with consultants and contractors for development works and capping program.	BSc(Eng) Dip(Eng) CEng MIEI, Chartered Engineer. F.Á.S. Waste Management Training Course. F.Á.S. Managing Safely in Construction Training Course.	9 years Consultant Structural Engineer with Kavanagh Mansfield & Partners. Joined the Environmental Services Department in January 2008.
Landfill Management, A/ Executive Scientist,	Mr. Mortimer Loftus	Balleally Landfill & HQ	Landfill Management. Management of Waste Licence Compliance. Supervision of scientific monitoring, reporting and liaison with the Environmental Protection Agency.	Ph.D. Ecology, B.Sc. Environmental Science, Dip Environmental Impact Assessment Management, Dip Environmental Management, F.Á.S. Waste Management Training	1996-2004 Soil Research and Mapping in Teagasc. Joined the Environmental Services Department in July 2004.

				Course. F.Á.S. Managing Safely in Construction Training Course.	
Landfill Management, Executive Engineer	Mr. David Devine	HQ & Balleally Landfill	Leachate Treatment Plant	BSc Civil Engineering, MIEI, Chartered Engineer, F.Á.S. Waste Management Training Course. F.Á.S. Managing Safely in Construction Training Course.	13 years Civil Engineering and Project Management experience, 5 Years local authority experience.
Landfill Foreman	Mr. John Lacey	Balleally Landfill	Deputy in the absence of the Landfill Manager, Waste Acceptance Manager, safety inspections and day to day supervision of staff.	Completed courses in Health and Safety (NIFAST), Manual Handling, Evasive Driving & Trenching. Also Fire Warden and Supervisors courses.	Over 30 years Local Authority Service. Assistant Foreman in Dunsink Landfill for 12 years before being appointed Foreman for Balleally Landfill in 1998.
Senior Engineer, Environment	Mr. J. Daly	HQ	Responsible for Waste Management Enforcement and Waste Infrastructure.	B.E. (Civil Engineering), 1986. M.Sc. Environmental Engineering, 1993. MIEI.	15 years Water Service and Waste Management experience. 14 years LA experience.
Senior Executive Engineer, Environment	Mr. M. Kiely	ΗΩ	Responsible for Waste Infrastructure within the Environment Department.	B.E. (Civil Engineering) 1977, F.Á.S. Waste Management Training Course.	Approx.30 years LA experience including 18 years Waste Management experience. Joined the Environmental Services Department of FCC in Jul 2001.

Version 1.1.13

REFERENCE YEAR 2011

1. FACILITY IDENTIFICATION

Parent Company Name	Fingal County Council
Facility Name	Balleally Landfill
PRTR Identification Number	W0009
Licence Number	W0009-03

Waste or IPPC Classes of Activity

Waste or IPPC Classes of Activity	
No.	class_name
	Specially engineered landfill, including placement into lined discrete
	cells which are capped and isolated from one another and the
3.5	environment.
3.1	Deposit on, in or under land (including landfill).
3.10	Release of waste into a water body (including a seabed insertion).
	Repackaging prior to submission to any activity referred to in a
3.12	preceding paragraph of this Schedule.
	,
	Storage prior to submission to any activity referred to in a preceding
	paragraph of this Schedule, other than temporary storage, pending
0.40	
3.13	collection, on the premises where the waste concerned is produced.
	Land treatment, including biodegradation of liquid or sludge
3.2	discards in soils.
	Surface impoundment, including placement of liquid or sludge
3.4	discards into pits, ponds or lagoons.
0.1	The treatment of any waste on land with a consequential benefit for
4.10	an agricultural activity or ecological system.
4.10	
	Use of waste obtained from any activity referred to in a preceding
4.11	paragraph of this Schedule.
	Exchange of waste for submission to any activity referred to in a
4.12	preceding paragraph of this Schedule.
	Storage of waste intended for submission to any activity referred to
	in a preceding paragraph of this Schedule, other than temporary
	storage, pending collection, on the premises where such waste is
4.10	
4.13	produced.
	Recycling or reclamation of organic substances which are not used
	as solvents (including composting and other biological
4.2	transformation processes).
4.3	Recycling or reclamation of metals and metal compounds.
4.4	Recycling or reclamation of other inorganic materials.
	Use of any waste principally as a fuel or other means to generate
10	energy.

2. PRTR CLASS ACTIVITIES

Activity Number	Activity Name
-----------------	---------------

5(d)	Landfills
5(c)	Installations for the disposal of non-hazardous waste
5(d)	Landfills
50.1	General
3. SOLVENTS REGULATIONS (S.I. No. 543 of 200	02)
Is it applicable?	
Have you been granted an exemption?	No
If applicable which activity class applies (as per	
Schedule 2 of the regulations) ?	
Is the reduction scheme compliance route being	
used ?
