Administration, Environmental Licensing Programme, Environmental Protection Agency, Inniscarra, County Cork. ection purpose

15<sup>th</sup> May 2012

# Ction purposes only. any other use. Register No. D0426-01 Dripsey WWYP

I enclose a submission to the Agency in response to the requirement for a Habitats Directive Assessment (Screening Report) for Dripsey WWTP.

This information is supplied in the form of two originals plus two electronic copies in PDF format as requested.

Yours Sincerely,

DANGLI

Roger O'Donnell, Wastewater Treatment & Pumping - Zone 3, The Lodge, Youghal Road, Midleton, Co. Cork.

# Question : Assess the likelihood of significant effects of the waste water discharge on the relevant European sites.

Habitats Directive Assessment (Screening Report) in respect of

Application by Cork County Council to the EPA for Wastewater Discharge License for Dripsey's WWTP. Licence Register Number D0426- 01 Concent May, 2012

# 1 Introduction

1.1 Dripsey is a village approximately 19 km west of Cork City and 3km north-east of Coachford off the R618 Cork to Macroom Road. Dripsey consists of three nodes of development, namely Model Village, Upper Dripsey and Lower Dripsey. The settlement is located on the east bank of the Dripsey River, which ultimately flows into the River Lee. The WWTP serves the Model Village area only.

The WWTP is located below the public road in the townland of Agharinagh, west of the Model Village. The plant is adjacent to the Dripsey River. The site is located well below road level.

A gravity combined sewer discharges to the waste water treatment plant. There is a significant amount of infiltration into the system.

The WWTP was built in the early 1990's and has a design PE of 600. Currently the WWTP is receiving flows of approximately 88m3/day, based on a daily demand of 225l/head/day and a PE of 390.

The wastewater enters the plant via a gravity sewer of diameter 225mm. The wastewater firstly enters a primary settlement tank. This was originally functioning as a septic tank before the plant was upgraded in the early 1990's. From here it flows through a Rotating Biological Contactor where aeration takes place. It then flows into a final setting tank and the treated effluent discharges from here to the river.

It is proposed that the replacement of the RBC will be an interim measure as an upgrade to the plant is being advanced under the Water Services Investment Programme.

The upgrade scheme was being progressed as a Serviced Land Initiative. The Preliminary Report was approved by the DoEHLG in September 2006. Cork County Council subsequently submitted a construction budget in Jury 2007 and has not received a reply to date. Approval for all SLI schemes was withdrawn by the DoEHLG as per Circular L3/09 issued in April 2009. A scheme to upgrade the WWTP is currently being progressed by the Water Services Investment Programme (WSIP) Office and it is currently at the planning stage.

It is proposed that the upgrade works will be carried out in two phases. Phase 1 will include modifications to the design and layout of the existing plant to facilitate future expansion and Phase 2 will provide for the expansion of the plant from 600PE to 1,200PE. As the project is likely to be a Design and Build Contract detailed design details are not available at this stage.

The WWTP is inspected twice weekly by a Curator.

The pollution load for the Dripsey agglomeration arises from the following areas: Domestic population Non-domestic users Infiltration and storm water

The non-domestic loading is minimal and consists of loadings from the public house and shop.

The sewage from all commercial activities is collected via the public sewer and treated in conjunction with the domestic waste at the septic tank.

The capacity of the treatment plant is approximately 600PE. At design capacity the plant would discharge 135m3/day (DWF) to the River Lee based on 225l/head/day. Analysis of the discharge has shown compliance with the Urban Wastewater Directive.

The waste water works is inspected twice weekly to ensure that no significant pollution is caused. Sampling of the effluent is carried out on occasions and monitoring of the Dripsey River upstream and downstream of the plant is carried out in accordance with the Water Framework Directive. An appendix is attached detailing the compliance level with the EQS standards for a number of parameters as set in SI 272 of 2009. The river downstream of the plant is compliant with Good/High status limits for the following parameters.

BOD, Ammonia ,Orthophosphate ,Dissolved Oxygen (both Upper & Lower limits) and pH.

## <u>Therefore it is reasonable to assume that there are no long-term adverse impacts on</u> water quality as a result of the discharge to this river.

Sludge storage is not provided in the plant and the plant is de-sludged on a regular basis. The proposed primary discharge point, SW01-Dripsey, is the main outlet from Dripsey Wastewater Treatment Plant. The point of discharge is a 100mm pipe, which discharges directly to the Dripsey River at a point approx 32km upstream of the Cork Harbour SPA. Further downstream the Dripsey River joins with the River Lee and flows into the Cork Harbour at the north western end of the Lough Mahon Estuary.

1.2 The plant is located approx. 32km upstream from the Cork Harbour Special Protection Area which is designated under the EU Birds Directive (79/409/EEC) as transposed into Irish Law under the European Union (Natural Habitats) Regulations SI 94/1997. As this is the case, and in accordance with requirements under this Directive, the potential impacts of proposed developments that have the potential to impact on Special Protection Areas must be assessed. The procedure to do this is called a Habitats Directive Assessment. The purpose of such an assessment is to identify whether there may be potential for elements of the project to have a significant impact on nature conservation sites within its impact zone, and if so, to predict the potential for such impacts to affect the overall integrity of such nature conservation sites. The European Union has provided guidance as to how to make a Habitats Directive Assessment which identifies four main stages in the process as follows:

## Stage One: Screening

The process which identifies the likely impacts upon a Natura 2000 site of a project or plan, whether alone or in combination with other projects or plans, and considers whether these impacts are likely to be significant.

## Stage Two: Appropriate assessment

The consideration of the impact on the integrity of the Natura 2000 site of the project or plan, either alone or in combination with other projects or plans, with respect to the site's structure and function and its conservation objectives. Additionally, where there are adverse impacts, an assessment of the potential mitigation of those impacts.

## Stage Three: Assessment of alternative solutions

The process which examines alternative ways of achieving the objectives of the project or plan that avoid adverse impacts on the integrity of the Natura 2000 site.

Stage Four: Assessment where no alternative solutions exist and where adverse impacts remain.

An assessment of compensatory measures, where in the light of an assessment of imperative reasons of overriding public interest, it is deemed that the project or plan should proceed.

1.3 This document brings together all of the information necessary to make determination as to whether there are likely to be significant impacts arising from the discharge from Dripsey WWTP on the adjacent Cork Harbour Special Protection Area and represents the first stage of this process (Screening).

# Step 1:

Provide a description of the plan and other plans and projects that, in combination, have the potential to have significant effects on Natura 2000 sites within the potential impact zone;

Step 2:

Identify Natura 2000 sites which may be impacted by the plan, and compile information on their qualifying interests and conservation objectives;

Step 3:

Determine whether the plan needs to be screened for potential impacts on Natura 2000 sites;

Step 4:

Carry out an assessment of likely effects – direct, indirect and cumulative – undertaken on the basis of available information as a desk study or field survey or primary research as necessary;

Step 5:

Assess the significance of any such effects on the Natura 2000 sites within the impact zone.

1.4 The assessment has been prepared in accordance with the following guidance:

European Commission (2000) Managing Natura 2000 sites: the provisions of Article 6 of the Habitats Directive 92/43/EEC.

European Commission (2001) Assessment of plans and projects significantly affecting Natura 2000 sites: Methodological guidance on the provisions of Articles 6(3) and (4) of the Habitats Directive 92/43/EEC.

Appropriate Assessment of Plans and Projects in Ireland. Guidance for Planning Authorities. Environment, Heritage and Local Government, 2009.

### 2.2 Description of the Natura 2000 sites within the potential impact zone<sup>1</sup>

| Name  | Cork Harbour Special Protection Area   |
|---|--|
| Site Code                                     | 4130   |
| Site Description                              | The Cork Harbour SPA is an estuarine complex which<br>is primarily comprised of intertidal habitats, mainly<br>mudflats as well as some other coastal and marine<br>habitats. These habitats support very high numbers of<br>wintering waterfowl that feed on the macro<br>invertebrates inhabiting the mudflats. The Harbour<br>regularly supports in excess of 20,000 wintering birds,<br>making it an internationally important site and the fifth<br>most important wintering waterfowl site in the country. |
|   | Dripsey WWTP discharges to the Dripsey River at a point approx 32Km upstream from the Cork Harbour SPA.  |
|   | The Dripsey River joins with the River Lee which is a salmonid river and flows into the Cork Harbour SPA at the North Western end of the Lough Mahon estuary where the main habitats of importance are intertidal mudflats.  |
|   | More information on the Cork Harbour SPA is<br>contained in appendix 1 of this document. Bird count<br>data is provided in appendix 4.   |
| Qualifying Interests of<br>Cork Harbour SPA.  | Internationally important numbers of Black-tailed<br>Godwit and Redshank; Nationally important numbers of<br>Cormorant, Shelduck, Oystercatcher, Golden Plover,<br>Lapwing, Dunlin and Curlew; 20,000 wintering water<br>birds. Source – National Parks and Wildlife Service<br>See appendix 4 for bird count data for Cork Harbour<br>1998/2000 – 2007/2008.  |
| Other Notable Features of<br>Cork Harbour SPA | Little Grebe, Great-crested Grebe, Grey Heron, Wigeon,<br>Teal, Pintail, Shoveler, Red-breasted Merganser, Grey<br>Plover, Black-headed Gull, Common Gull, Lesser<br>Black-backed Gull, wetland and water birds. Source –<br>National Parks and Wildlife Service   |
|   | See appendix 4 for bird count data for Cork Harbour 1998/2000 – 2007/2008.   |

<sup>&</sup>lt;sup>1</sup> Natura 2000 sites within the potential impact zone of the proposed development have been identified in accordance with guidance provided in the NPWS circular L8/08.

| Conservation Objectives | To avoid deterioration of the habitats of the qualifying<br>species and species of special conservation interest, or<br>significant disturbance to these species, thus ensuring<br>that the integrity of the site is maintained.  |
|-------------------------|---|
|                         | To ensure for the qualifying species and species of special conservation interest that the following are maintained in the long-term.   |
|                         | <ul> <li>the population of the species as a viable component of the site;</li> <li>the distribution and extent of habitats supporting the species;</li> <li>the structure, function and supporting processes of habitats supporting the species;</li> <li>Source – National Parks and Wildlife Service</li> </ul> |

| 2.3 Assessment Criteria   |  |
|---|--|
| Describe the individual<br>elements of the project<br>(either alone or in<br>combination with other<br>plans or projects) likely to<br>give rise to impacts on the<br>Natura 2000 site. | Discharge from Dripsey WWTP<br>The treated effluent discharges from the WWTP to the<br>Dripsey River which combines with the River Lee. The<br>Cork Harbour SPA is approx 32 km from the point of<br>discharge.<br>The discharge consists of treated effluent from the<br>WWTP and while the UWW regulations do not set<br>statutory timits for plants below 2000PE the discharge<br>results for 2011 and 2012 to date are compliant with the<br>UWW regulation limits for BOD/COD and Suspended<br>Solids.<br>Other Significant Discharges between Cork Harbour<br>SPA and Dripsey WWTP:<br>Treated Wastewater from the Ballincollig<br>agglomeration discharges to the river Lee approx 13Km<br>upstream of the Cork Harbour SPA. It should be noted<br>that this facility has a Waste Water Discharge Licence<br>(D0043-01).<br>Treated Wastewater from the Blarney agglomeration<br>discharges to the Shournagh River which combines with<br>the River Lee approx 19Km upstream of the Cork<br>Harbour SPA.<br>It should be noted that this facility has a Waste Water<br>Discharge Licence (D0049-01).<br>Treated Wastewater from Coachford discharges to the<br>River Lee approx 32Km upstream of the Cork Harbour<br>SPA. |

| Describe any likely direct,<br>indirect or secondary<br>impacts of the project<br>(either alone or in<br>combination with other<br>plans or projects) on the<br>Natura 2000 site taking<br>into account the following:   | Discharges could give rise to elevated nutrients entering<br>the Western portion of Cork Harbour. Increased<br>nutrient levels may impact on the ecology of an area by<br>changing the composition of floral communities and<br>reducing the ability of less robust plants to survive.<br>Increased nutrient levels may also result in increasing<br>the invertebrate populations in the estuary, thereby<br>increasing bird population levels.  |
|--|--|
| Size and scale<br>Land-take<br>Distance from the Natura  | However the potential for the WWTP discharge to result<br>in elevated nutrients within the harbour is reduced by<br>the following factors:   |
| 2000 site or key features of<br>the site:<br>Resource requirements<br>(water abstraction etc.)<br>Emissions (disposal to<br>land, water or air)<br>Excavation Requirements<br>Transportation<br>Requirements<br>Duration of construction,<br>operation,<br>decommissioning<br>Other. | The quality of the effluent is good.<br>From the monitoring data available there is no<br>significant deterioration in water quality in the rivers<br>downstream of the discharge.<br>The discharge from the plant is approx 32Km upstream<br>from Cork Harbour SPA and the River Lee enters the<br>Cork Harbour SPA at the North Western end of Lough<br>Mahon which is a large and well exchanged body of<br>water with unlimited dilution capacity.<br>1 Dripsey WWTP is currently being operated by<br>Cork County Council. The site is visited at least twice<br>par weak for increation of maintenance |
|  | per week for inspection and maintenance.<br>Note 1: See appendix 3 for effluent quality results for 2011 and 2012 to date<br>Note 2: As overflows occur in times of heavy rain the assumption must be made that what is discharged is diluted.   |
|  | <ul> <li>2 No deterioration in water quality in the Rivers downstream.</li> <li>According to the upstream and downstream monitoring carried out there is no significant deterioration in water quality associated with the Dripsey WWTP discharge.</li> </ul>  |
|  | Note 1: See appendix 3 for upstream and downstream monitoring data for 2011.<br>It should also be noted that the Dripsey river is  |
|  | classified as Good status in the WFD status report on<br>the EPA envision map scheme.  |
|  | Treated effluent discharges into Harbour body<br>The treated effluent enters the Cork Harbour SPA at the<br>North Western End of the Lough Mahon Estuary which<br>is a large and well exchanged body of water with<br>unlimited dilution capacity. The endless dilution<br>capability of the harbour body of water means that the<br>discharge is properly diluted once within the SPA.  |

|   | The point of discharge is also approx 32km upstream of the Cork Harbour SPA.   |  |  |  |  |  |
|---|--|--|--|--|--|--|
| Describe any likely<br>changes to the site arising<br>as a result of:<br>Reduction in habitat area<br>Disturbance to key species<br>Habitat or species                                  | Reduction in habitat area:<br>Effluent is discharging to a large well-exchanged body<br>of water where dilution and dispersion potential is high.<br>No significant impacts are evident or predicted on<br>habitats within the Cork Harbour arising from the<br>operation of this facility.        |  |  |  |  |  |
| fragmentation<br>Reduction in species<br>density<br>Changes in key indicators   | Disturbance to key species:<br>The operation of the WWTP does not cause any<br>disturbance to species within the SPA.  |  |  |  |  |  |
| of conservation value<br>(water quality etc)<br>Climate Change  | Habitat or species fragmentation:<br>No habitat fragmentation has been caused as a result of<br>the operation of this facility.  |  |  |  |  |  |
|   | Reduction in species density:<br>Effluent is discharging to a large well-exchanged body<br>of water where dilution and dispersion potential is high.<br>No significant impacts are evident or predicted on<br>species for which the SPA is designated.   |  |  |  |  |  |
|   | Changes in key indicators of conservation value e.g.<br>water quality:<br>Monitoring of the revers water quality indicates that<br>there is no significant deterioration in water quality<br>associated with the Dripsey discharge. See appendix 3<br>for upstream and downstream monitoring data. |  |  |  |  |  |
|   | It should also be noted that the Dripsey river is<br>classified as Good status in the WFD status report on<br>the EPA envision map scheme  |  |  |  |  |  |
| Describe any likely<br>impacts on the Natura<br>2000 site as a whole in<br>terms of:  | Interference with the key relationships that define the structure of the site:<br>The structure of the SPA is not impacted by the operation of this facility.  |  |  |  |  |  |
| Interference with the key<br>relationships that define<br>the structure of the site<br>Interference with key<br>relationships that define<br>the function of the site                   | Interference with key relationships that define the function of the site:<br>The function of the SPA is not impacted by the operation of this facility.  |  |  |  |  |  |
| Describe from the above<br>those elements of the<br>project of plan, or<br>combination of elements,<br>where the above impacts<br>are likely to be significant<br>or where the scale or | No significant impacts are predicted.  |  |  |  |  |  |

| magnitude of impacts is |  |

| l  |  |

| The assessment of significance of effects   |   |  |  |  |
|---|---|--|--|--|
| Describe how the project<br>or plan (alone or in<br>combination) is likely to<br>affect the Natura 2000 Site. | Discharges from Dripsey WWTP either alone or in<br>combination with discharges from other sources could<br>give rise to elevated nutrients entering the Western<br>portion of Cork Harbour. Increased nutrient levels may<br>impact on the ecology of an area by changing the<br>composition of floral communities and reducing the<br>ability of less robust plants to survive. Increased<br>nutrient levels may also result in increasing the<br>invertebrate populations in the estuary, thereby<br>increasing bird population levels. |  |  |  |
|   | Effluent discharged from Saleen Septic tank or from the discharge points from the Whitegate/Aghada agglomeration may be having a negative impact on the Cork Harbour SPA, it is considered that the discharge from Dripsey WWTP is not contributing to this impact because of its distance from Cork Harbour SPA and because of the large dilution capacity of the River Lee.   |  |  |  |
| Explain why these effects<br>are not considered<br>significant.   | Treated effluent discharges approx 32Km upstream of<br>the SPA and the river discharges to a large well-<br>exchanged body of water where dilution and dispersion<br>potential is high. No significant impacts are evident or<br>predicted on species for which the SPA is designated.  |  |  |  |

# Dripsey Flow Chart – D0426-01

**Assess Impacts** 

#### SITE SYNOPSIS

### SITE NAME: CORK HARBOUR SPA

#### SITE CODE: 004030

Cork Harbour is a large, sheltered bay system, with several river estuaries - principally those of the Rivers Lee, Douglas and Owenacurra. The SPA site comprises most of the main intertidal areas of Cork Harbour, including all of the North Channel, the Douglas Estuary, inner Lough Mahon, Lough Beg, Whitegate Bay and the Rostellan inlet.

Owing to the sheltered conditions, the intertidal flats are often muddy in character. These muds support a range of macro-invertebrates, notably *Macoma balthica*, *Scrobicularia plana*, *Hydrobia ulvae*, *Nepthys hombergi*, *Nereis diversicolor* and *Corophium volutator*. Green algae species occur on the flats, especially *Ulva lactua* and *Enteromorpha* spp. Cordgrass (*Spartina* spp.) has colonised the intertidal flats in places, especially where good shelter exists, such as at Rossleague and Belvelly in the North Channel. Salt marshes are scattered through the site and these provide high tide roosts for the birds. Salt marsh species present include Sea Purslane (*Halimione portulacoides*), Sea Aster (*Aster tripolium*), Thrift (*Armeria maritima*), Common Saltmarsh-grass (*Puccinellia maritima*), Sea Plantain (*Plantago maritima*), Laxflowered Sea-lavender (*Limonium humile*) and Sea Arrowgrass (*Triglochin maritima*). Some shallow bay water is included in the site. Cork Harbour is adjacent to a major urban centre and a major industrial centre. Rostellan lake is a small brackish lake that is used by swans throughout the winter. The site also includes some marginal wet grassland areas used by feeding and roosting birds.

Cork Harbour is an internationally important wetland site, regularly supporting in excess of 20,000 wintering waterfowl, for which it is amongst the top five sites in the country. The five-year average annual core count for the entire harbour complex was 34,661 for the period 1996/97-2000/01. Of particular note is that the site supports an internationally important population of Redshank (1,614) - all figures given are average winter means for the 5 winters 1995/96-1999/00. A further 15 species have populations of national importance, as follows: Great Crested Grebe (218), Cormorant (620), Shelduck (1,426), Wigeon (1,750), Gadwall (15), Teal (807), Pintail (84), Shoveler (135), Red-breasted Merganser (90), Oystercatcher (791), Lapwing (3,614), Dunlin (4,936), Black-tailed Godwit (412), Curlew (1,345) and Greenshank (36). The Shelduck population is the largest in the country (9.6% of national total), while those of Shoveler (4.5% of total) and Pintail (4.2% of total) are also very substantial. The site has regionally or locally important populations of a range of other species, including Whooper Swan (10), Pochard (145), Golden Plover (805), Grey Plover (66) and Turnstone (99). Other species using the site include Bat-tailed Godwit (45), Mallard (456), Tufted Duck (97), Goldeneye (15), Coot (77), Mute Swan (39), Ringed Plover (51), Knot (31), Little Grebe (68) and Grey Heron (47). Cork Harbour is an important

site for gulls in winter and autumn, especially Common Gull (2,630) and Lesser Black-backed Gull (261); Black-headed Gull (948) also occurs.

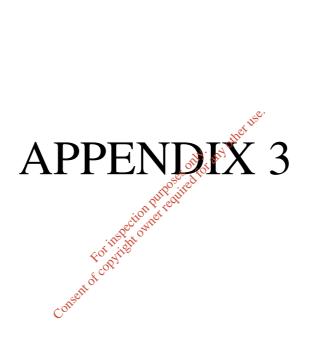

A range of passage waders occur regularly in autumn, including Ruff (5-10), Spotted Redshank (1-5) and Green Sandpiper (1-5). Numbers vary between years and usually a few of each of these species over-winter.

The wintering birds in Cork Harbour have been monitored since the 1970s and are counted annually as part of the I-WeBS scheme.

Cork Harbour has a nationally important breeding colony of Common Tern (3-year mean of 69 pairs for the period 1998-2000, with a maximum of 102 pairs in 1995). The birds have nested in Cork Harbour since about 1970, and since 1983 on various artificial structures, notably derelict steel barges and the roof of a Martello Tower. The birds are monitored annually and the chicks are ringed.

Extensive areas of estuarine habitat have been reclaimed since about the 1950s for industrial, port-related and road projects, and further reclamation remains a threat. As Cork Harbour is adjacent to a major urban centre and a major industrial centre, water quality is variable, with the estuary of the River Lee and parts of the Inner Harbour being somewhat eutrophic. However, the polluted conditions may not be having significant impacts on the bird populations. Qil pollution from shipping in Cork Harbour is a general threat. Recreational activities are high in some areas of the harbour, including jet skiing which causes disturbance to roosting birds.

Cork Harbour has is of major ornithological significance, being of international importance both for the total numbers of wintering birds (i.e. > 20,000) and also for its population of Redshank. In addition, there are at least 15 wintering species that have populations of national importance, as well as a nationally important breeding colony of Common Tern. Several of the species which occur regularly are listed on Annex I of the E.U. Birds Directive, i.e. Whooper Swan, Golden Plover, Bar-tailed Godwit, Ruff and Common Tern. The site provides both feeding and roosting sites for the various bird species that use it.
