DISCLAIMER

This report is presented to Bord Gais in respect of the former gasworks site, Limerick and may not be used or relied on by any other person or by the client in relation to any other matters not covered specifically by the scope of this Report.

Notwithstanding anything to the contrary contained in the report, Mouchel Limited is obliged to exercise reasonable skill, care and diligence in the performance of the services required by Bord Gais and Mouchel Limited shall not be liable except to the extent that it has failed to exercise reasonable skill, care and diligence, and this report shall be read and construed accordingly.

This report has been prepared by Mouchel Limited. No individual is personally liable in connection with the preparation of this report. By receiving this report and acting on it, the client or any other person accepts that no individual is personally liable whether in contract, tort, for breach of statutory duty or otherwise.

Mouchel has used reasonable skill, care and diligence in the design and interpretation of the ground investigation, however, the inherent variability of ground conditions allows only definition of the actual conditions at the location and depths of exploratory holes and samples/tests therefrom, while at intermediate locations conditions can only be inferred.

New information, changed practices or new legislation may necessitate revised interpretation of the report after the date of its submission.

Executive Summary

Appointment	Mouchel were appointed by Bord Gais Eireann to undertake further site characterisation works following removal of the AGI infrastructure and transfer of ownership of the former Horse Pound area from Shannon Foynes Port Company to Bord Gais. This addendum report updates the March 2010 Quantitative Risk Assessment, Options Appraisal and Remediation Strategy report, reference 1021927/R/03 B following the drilling of an additional eleven sonic boreholes in October 2011.
2011 Site Characterisation Works	Works were undertaken in the two areas of the site that were not accessible during the 2009 Characterisation works. Sonic drilling was undertaken in the eleven grid cells in these two areas – A1, A2, B1, B2, C1, C2, D2, A9, A10, B9 and B10.
Potential Pollutant Linkages	<p>The potential pollutant linkages with respect to human health are:-</p> <ul style="list-style-type: none"> • Ingestion/ direct contact of soil for future site occupiers • Inhalation/ ingestion/ direct contact of soil dust for future site occupiers and adjacent site occupiers, and • Inhalation of soil gas/ volatiles for future site occupiers and adjacent site occupiers. <p>The potential pollutant linkages with respect to water are:-</p> <ul style="list-style-type: none"> • Soil (including free phase hydrocarbons) leaching to groundwater impacting the River Shannon, and • Groundwater (dissolved and free phase contaminants) impacting the River Shannon.
Human Health Detailed Quantitative Risk Assessment (DQRA)	The 2011 dataset has been assessed separately of the 2009 dataset. Exceedences were identified for each of the three proposed end uses. However, the maximum concentrations recorded do not exceed the 2009 maximum concentrations therefore it is considered that the Remediation Target Values (RTV's) presented in the March 2010 report are still valid. Similarly, the vapour pathway modelling has not been revised given the low concentrations of the volatile determinants recorded.
Groundwater/ Surface Water Quantitative Risk assessment	Quarterly ground water monitoring, sampling and testing has been undertaken since December 2009 and reported separately. As a result, there is not considered a need to update this assessment.
Remediation Options Appraisal and Strategy	Following assessment of the 2011 dataset, it is not considered necessary to revise the remedial options appraisal or remediation strategy presented in the March 2010 report.
Recommendations	<p>The conclusions presented in the March 2010 Quantitative Risk Assessment, Options Appraisal and Remediation Strategy report. 1021927/R/03 B are unchanged following the above assessments.</p> <p>The following recommendation presented in the March 2010 Quantitative Risk Assessment, Options Appraisal and Remediation Strategy report. 1021927/R/03 B is considered to be still valid.</p> <ol style="list-style-type: none"> 1. Undertake some further preparatory works on site prior to remediation works commencing. These include demolition of the Governor House, Booster House and connecting internal walls and construction of a DRI (District Regulator Installation) together with the relocation of the ESB sub-station near the boundary with O'Curry Street. <p>The obtaining of large bulk samples of contaminated soils to undertake bench trials to allow selection of an appropriate binder for the stabilisation/ solidification works will form part of the phase 2 remediation pilot works.</p>

1 Introduction

Mouchel were appointed by Bord Gais Eireann to undertake further site characterisation works at the Limerick gasworks site following removal of the AGI infrastructure and transfer of ownership of the former Horse Pound area from Shannon Foynes Port Company to Bord Gais.

This addendum report updates the March 2010 Quantitative Risk Assessment, Options Appraisal and Remediation Strategy report, reference 1021927/R/03 B (2010 QRA report) following the drilling of an additional eleven sonic boreholes in October 2011 to complete the site characterisation. This addendum report must be read in conjunction with the 2010 QRA report and should not be read as a stand alone report.

For inspection purposes only.
Consent of copyright owner required for any other use.

2 Basis of Site information

2.1 2011 Site Characterisation – Summary of site works

The 2011 Site Characterisation works were undertaken in the former AGI and the former Horse Pound that were not accessible during the 2009 Characterisation works. Sonic drilling was undertaken by IGSL Ltd in the eleven grid cells in these two areas – A1, A2, B1, B2, C1, C2, D2, A9, A10, B9 and B10.

The exploratory hole location plan is presented as Drawing 1021927/R18/OD/01.

The table below summarises the 2009 and 2011 site characterisation works.

Table 2.1: Summary of Site Activities

Activity	Dates Undertaken	Exploratory Hole Reference	Maximum Depth
Sonic drilled boreholes	4 th November – 24 th November 2009	132 locations referenced by alpha-numeric grid cell reference	12m bgl
	25 th October – 27 th October 2011	11 locations referenced by alpha-numeric grid cell reference	5.5m bgl
Window sample holes	25 th November – 27 th November 2009	13 locations (C12AWS, C12BWS, D12WS, E12WS, F12WS, F10WS, F12WS, L11WS, L12WS, L1WS, M1WS, N1WS, N2WS)	4.0m bgl
Trial pits	9 th November – 10 th November 2009	3 locations (TP1, TP2, TP3)	5.0m bgl
Soak away pits	9 th November 2009	1 location (“soakaway”)	2.1m bgl

Soil samples were selected at approximately 1m intervals, or significant strata changes, and submitted for chemical analysis.

A full record of the Site Characterisation works is presented in the Site Investigation Factual Report 1021927/R/02C dated November 2011.

The 2011 chemical test data is presented in Appendix A.

The table below summarises the drawings that have been revised following assessment of the results of the 2011 characterisation works.

Table 2.2: Summary of Updated Drawings

Consent of copyright owner required for any other use.

3 Conceptual Site Model

3.1 Conceptual Site Model

A conceptual model for the site, is presented as Figure 9 in report 1021927/R/03 dated March 2010. No amendments are proposed to the conceptual site model in light of the findings of the 2011 site characterisation works.

Site specific geology recorded during the 2011 characterisation works generally corresponds with the findings from the 2009 characterisation works. No significant NAPL was encountered during the 2011 works.

For inspection purposes only.
Consent of copyright owner required for any other use.

4 Human Health Quantitative Risk Assessment

4.1 Introduction

For further information on the derivation of generic screening values, reference should be made to the 2010 QRA Report.

Due to the large dataset from the 2009 site characterisation, it was not possible to fit every sample onto one spreadsheet and previously, the data was split into two by location row ie A-G and H-L. It was not possible to add the 2011 data to the original spreadsheets and therefore the 2011 dataset was screened separately. The 95% confidence limits for the 2011 dataset were compared to the 95% confidence limits from the 2009 dataset to try and establish if the 2011 dataset is more or less contaminated.

4.2 Tier 1 – Human health screening

4.2.1 Commercial Scenario

Screening of the 2011 dataset indicates an exceedence of the 95% confidence limit for benzo(a)pyrene only. Exceedences of the screening values occur at 3 locations and these are not highlighted as statistical outliers. However, it is considered likely that these represent contamination hotspots.

Further exceedences of the screening values were recorded for aliphatic hydrocarbons C₁₂ to C₁₆ (1 location) and vinyl chloride (1 location).

Table 4.1 below compares the 95% confidence limit exceedences for the 2009 dataset with the 95% confidence limits for the 2011 dataset. 2011 screening tables are presented in Appendix B.

Table 4.1. Comparison of 2009 UCL 95 exceedences with the 2011 UCL 95 values – commercial / industrial screening

Type	Determinand	Screening Value (mg/kg)	2011 Dataset UCL95	UCL95 average – 2009
TPH	Aliphatic C ₁₂ -C ₁₆	59	22.26	397
PAH	Naphthalene	183	31.93	1447
	Acenaphthylene	212	4.73	225
	Benzo(a)pyrene	14	15.25	80
	Benzo(a)anthracene	95	16.5	103

4.2.2 Public Open Space Scenario

Screening of the 2011 dataset indicates an exceedence of the 95% confidence limit for benzo(a)pyrene only. 11 of 22 samples exceed the screening value. None are highlighted as statistical outliers.

Further exceedences of the screening values were recorded for benzo(a)anthracene (3 locations); chrysene (2 locations); benzo(b)fluoranthene (2 locations); indeno(1,2,3-c,d)pyrene (2 locations) and dibenzo(a,h)anthracene (2 locations). None are highlighted as statistical outliers.

Table 4.2 below compares the 95% confidence limit exceedences for the 2009 dataset with the 95% confidence limits for the 2011 dataset. Screening tables are presented in Appendix B.

Table 4.2. Comparison of 2009 UCL 95 exceedences with the 2011 UCL 95 values – public open space screening

Type	Determinands	Screening Value (mg/kg)	2011 Dataset UCL95	UCL95 average – 2009
PAH	Dibenzo(ah)anthracene	3.9	2.44	10.6
	Chrysene	36	12.52	79
	Benzo(a)pyrene	4.1	15.25	80
	Benzo(a)anthracene	26	16.5	103
	Benzo(b)fluoranthene	28	19.68	96.4
	Indeno(123-cd)pyrene	7	7.90	38

4.2.3 Residential Without Plant Uptake Scenario

Screening of the 2011 dataset indicates exceedences of the 95% confidence limit for aliphatic C₁₆ to C₃₅, benzo(a)anthracene, benzo(b)fluoranthene, benzo(a)pyrene, indeno(1,2,3-c,d)pyrene and dibenzo(a,h)anthracene.

The limit of detections for PCB's, carbon tetrachloride (one result only), vinyl chloride and 1,2-dichloroethane exceed the screening values, but since all results are less than the limit of detection, no significant risk is considered to exist.

Further exceedences of the screening values were recorded for benzene (1 location); aliphatic C₈ to C₁₀ (1 location); aliphatic C₁₂ to C₁₆ (1 location); aliphatic C₃₅ to C₄₄ (3 locations); aromatic C₈ to C₁₀ (1 location); aromatic C₁₆ to C₂₁ (1 location); aromatic C₂₁ to C₃₅ (1 location) and naphthalene (3 locations). Only benzene and aromatic C₈ to C₁₀ are highlighted as statistical outliers.

Table 4.3 below compares the 95% confidence limit exceedences for the 2009 dataset with the 95% confidence limits for the 2011 dataset. Screening tables are presented in Appendix B.

Table 4.3 Comparison of 2009 UCL 95 exceedences with the 2011 UCL 95 values – residential without gardens screening

Type	Analyte	Screening Value (mg/kg)	2011 Dataset UCL95	UCL95 average – 2009
TPH	Aliphatic C12-16	59.1	22.6	397
	Aliphatic C16-35	21.2	103.26	983
	Aliphatic C35-44	21.2	10.79	62
PAH	Benzo(b)fluoranthene	7.3	19.68	96
	Benzo(k)fluoranthene	10	6.73	41
	Benzo(a)pyrene	1	15.25	80
	Benzo(a)anthracene	5.2	16.5	103
	Indeno(123-cd)pyrene	4.4	7.9	38
	Dibenzo(ah)anthracene	0.91	2.44	10.6
BTEX	Benzene	0.49	0.46	45

4.2.4 Dutch Intervention Values – Residential Scenario

Screening of the 2011 dataset indicates an exceedence of the 95% confidence limit for the sum of 10 PAH's.

Further exceedences of the screening values were recorded for copper (1 location); cyanide (1 location); benzene (1 location); xylenes (1 location) and cresol (2 locations); All are highlighted as statistical outliers.

Table 4.3 below compares the 95% confidence limit exceedences for the 2009 dataset with the 95% confidence limits for the 2011 dataset. Screening tables are presented in Appendix B.

Table 4.4 Comparison of 2009 UCL 95 exceedences with the 2011 UCL 95 values – residential (Dutch) Intervention Values

Type	Determinand	Screening Value (mg/kg)	2011 Dataset UCL95	UCL95 average – 2009
PAH	Sum of 10 PAHs	40	138.30	2852
BTEX	Benzene	1	0.46	45
	Xylenes	25	5.38	137
Inorganics	Cyanide	70	32.07	473

4.2.5 Asbestos

At least one made ground sample from each location was tested for asbestos which was identified at the following locations:-

A9 0.0m to 0.7m – chrysotile (white)

B9 1.0m to 1.8m – amosite (brown); chrysotile (white); crocidolite (blue)

B10 0.0m to 0.4m - amosite (brown); chrysotile (white);

4.2.6 Summary of Tier 1 Human Health Risk Assessment

Exceedences identified within the 2011 dataset for all land uses were also identified in the 2009 dataset, although at significantly lower concentrations.

No revision of the human health or groundwater remedial target values (RTV's) detailed in Section 4.4 of the 2010 QRA Report are considered necessary following the above assessment.

4.3 Tier 2 - Quantitative Vapour Modelling

The quantitative vapour modelling presented in the 2010 QRA Report has been reviewed but not updated. None of the contaminants of concern identified and assessed previously have been identified in the 2011 dataset at concentrations in excess of the 2009 dataset. Therefore the findings and conclusions of the vapour modelling are considered to still be valid following the 2011 characterisation works. No amendment to the RTV's are considered necessary.

5 Groundwater / Surface Water Quantitative Risk Assessment

Quarterly ground water monitoring, sampling and testing has been undertaken since December 2009 and reported separately. Therefore there is not considered a need to update this risk assessment.

For inspection purposes only.
Consent of copyright owner required for any other use.

6 Remedial Options Appraisal

None of the chemical test results assessed above are significantly greater than the results recorded during the 2009 characterisation. Therefore it is not considered necessary to revise the remedial options appraisal presented in the 2010 QRA Report.

For inspection purposes only.
Consent of copyright owner required for any other use.

7 Remediation Strategy

It is not considered necessary to revise the remediation strategy presented in the 2010 QRA Report.

For inspection purposes only.
Consent of copyright owner required for any other use.

8 Conclusions/Recommendations

8.1 Conclusions

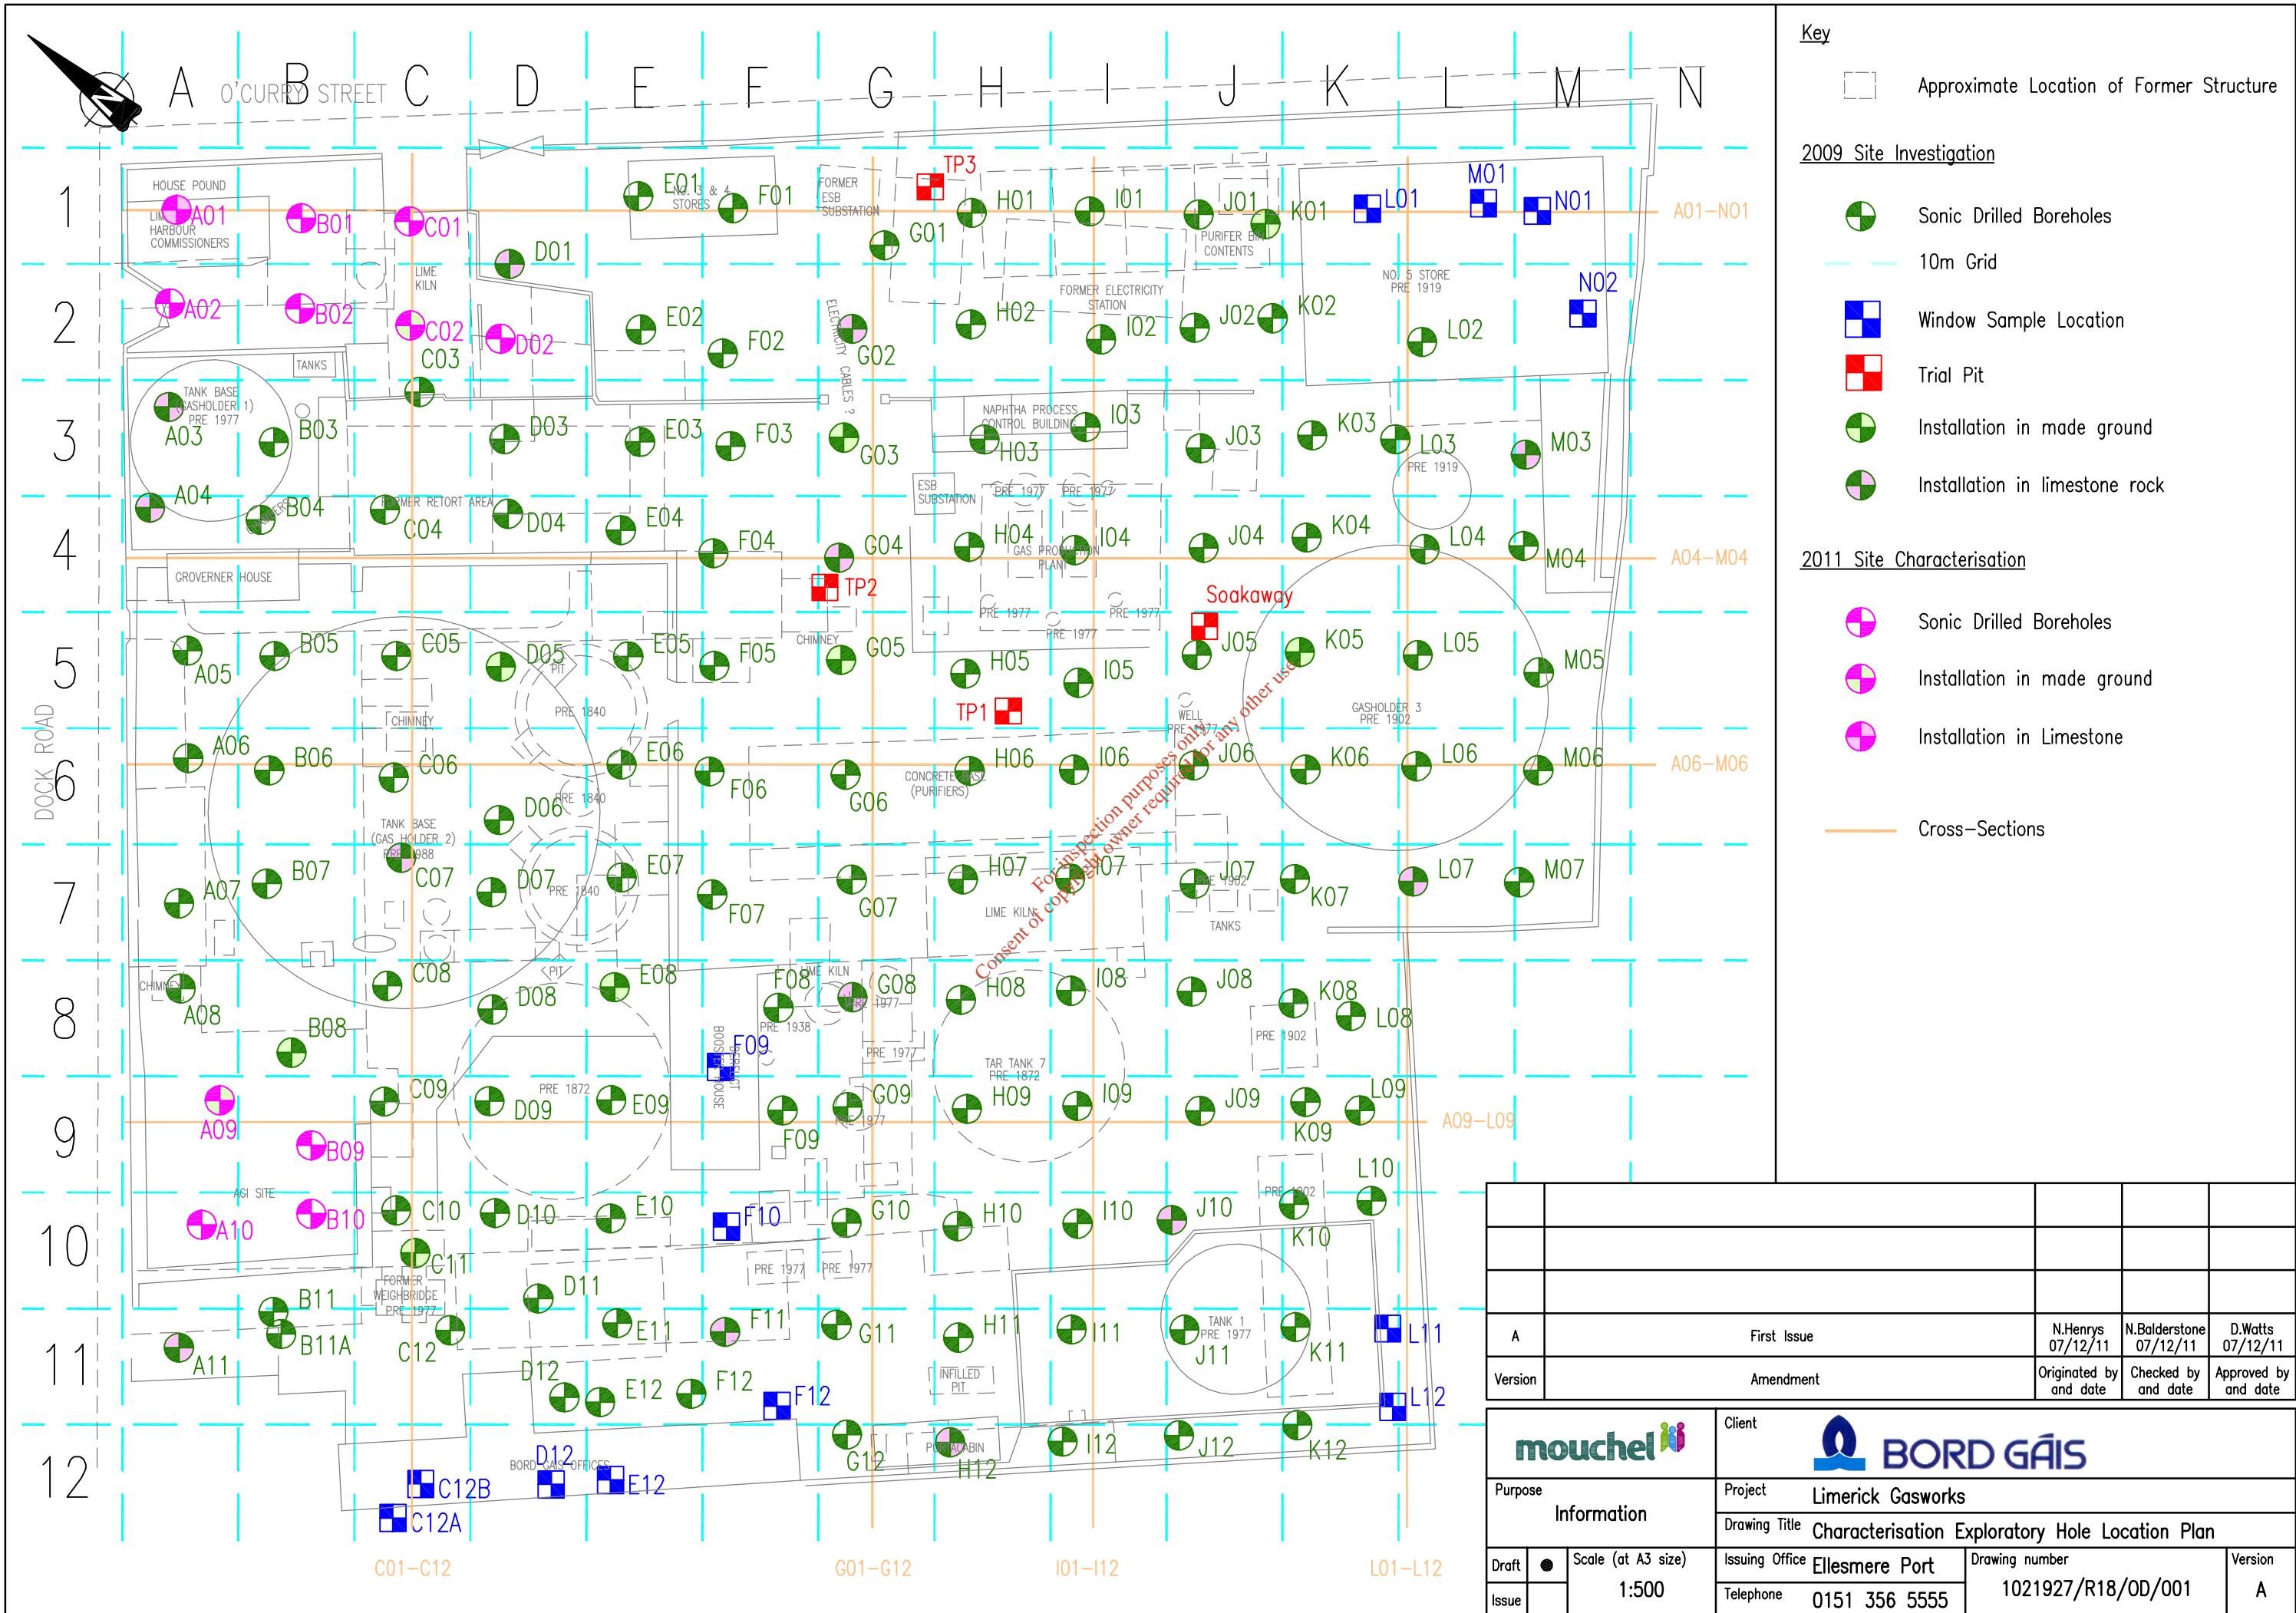

The conclusions presented in the 2010 QRA Report are unchanged following the above assessments.

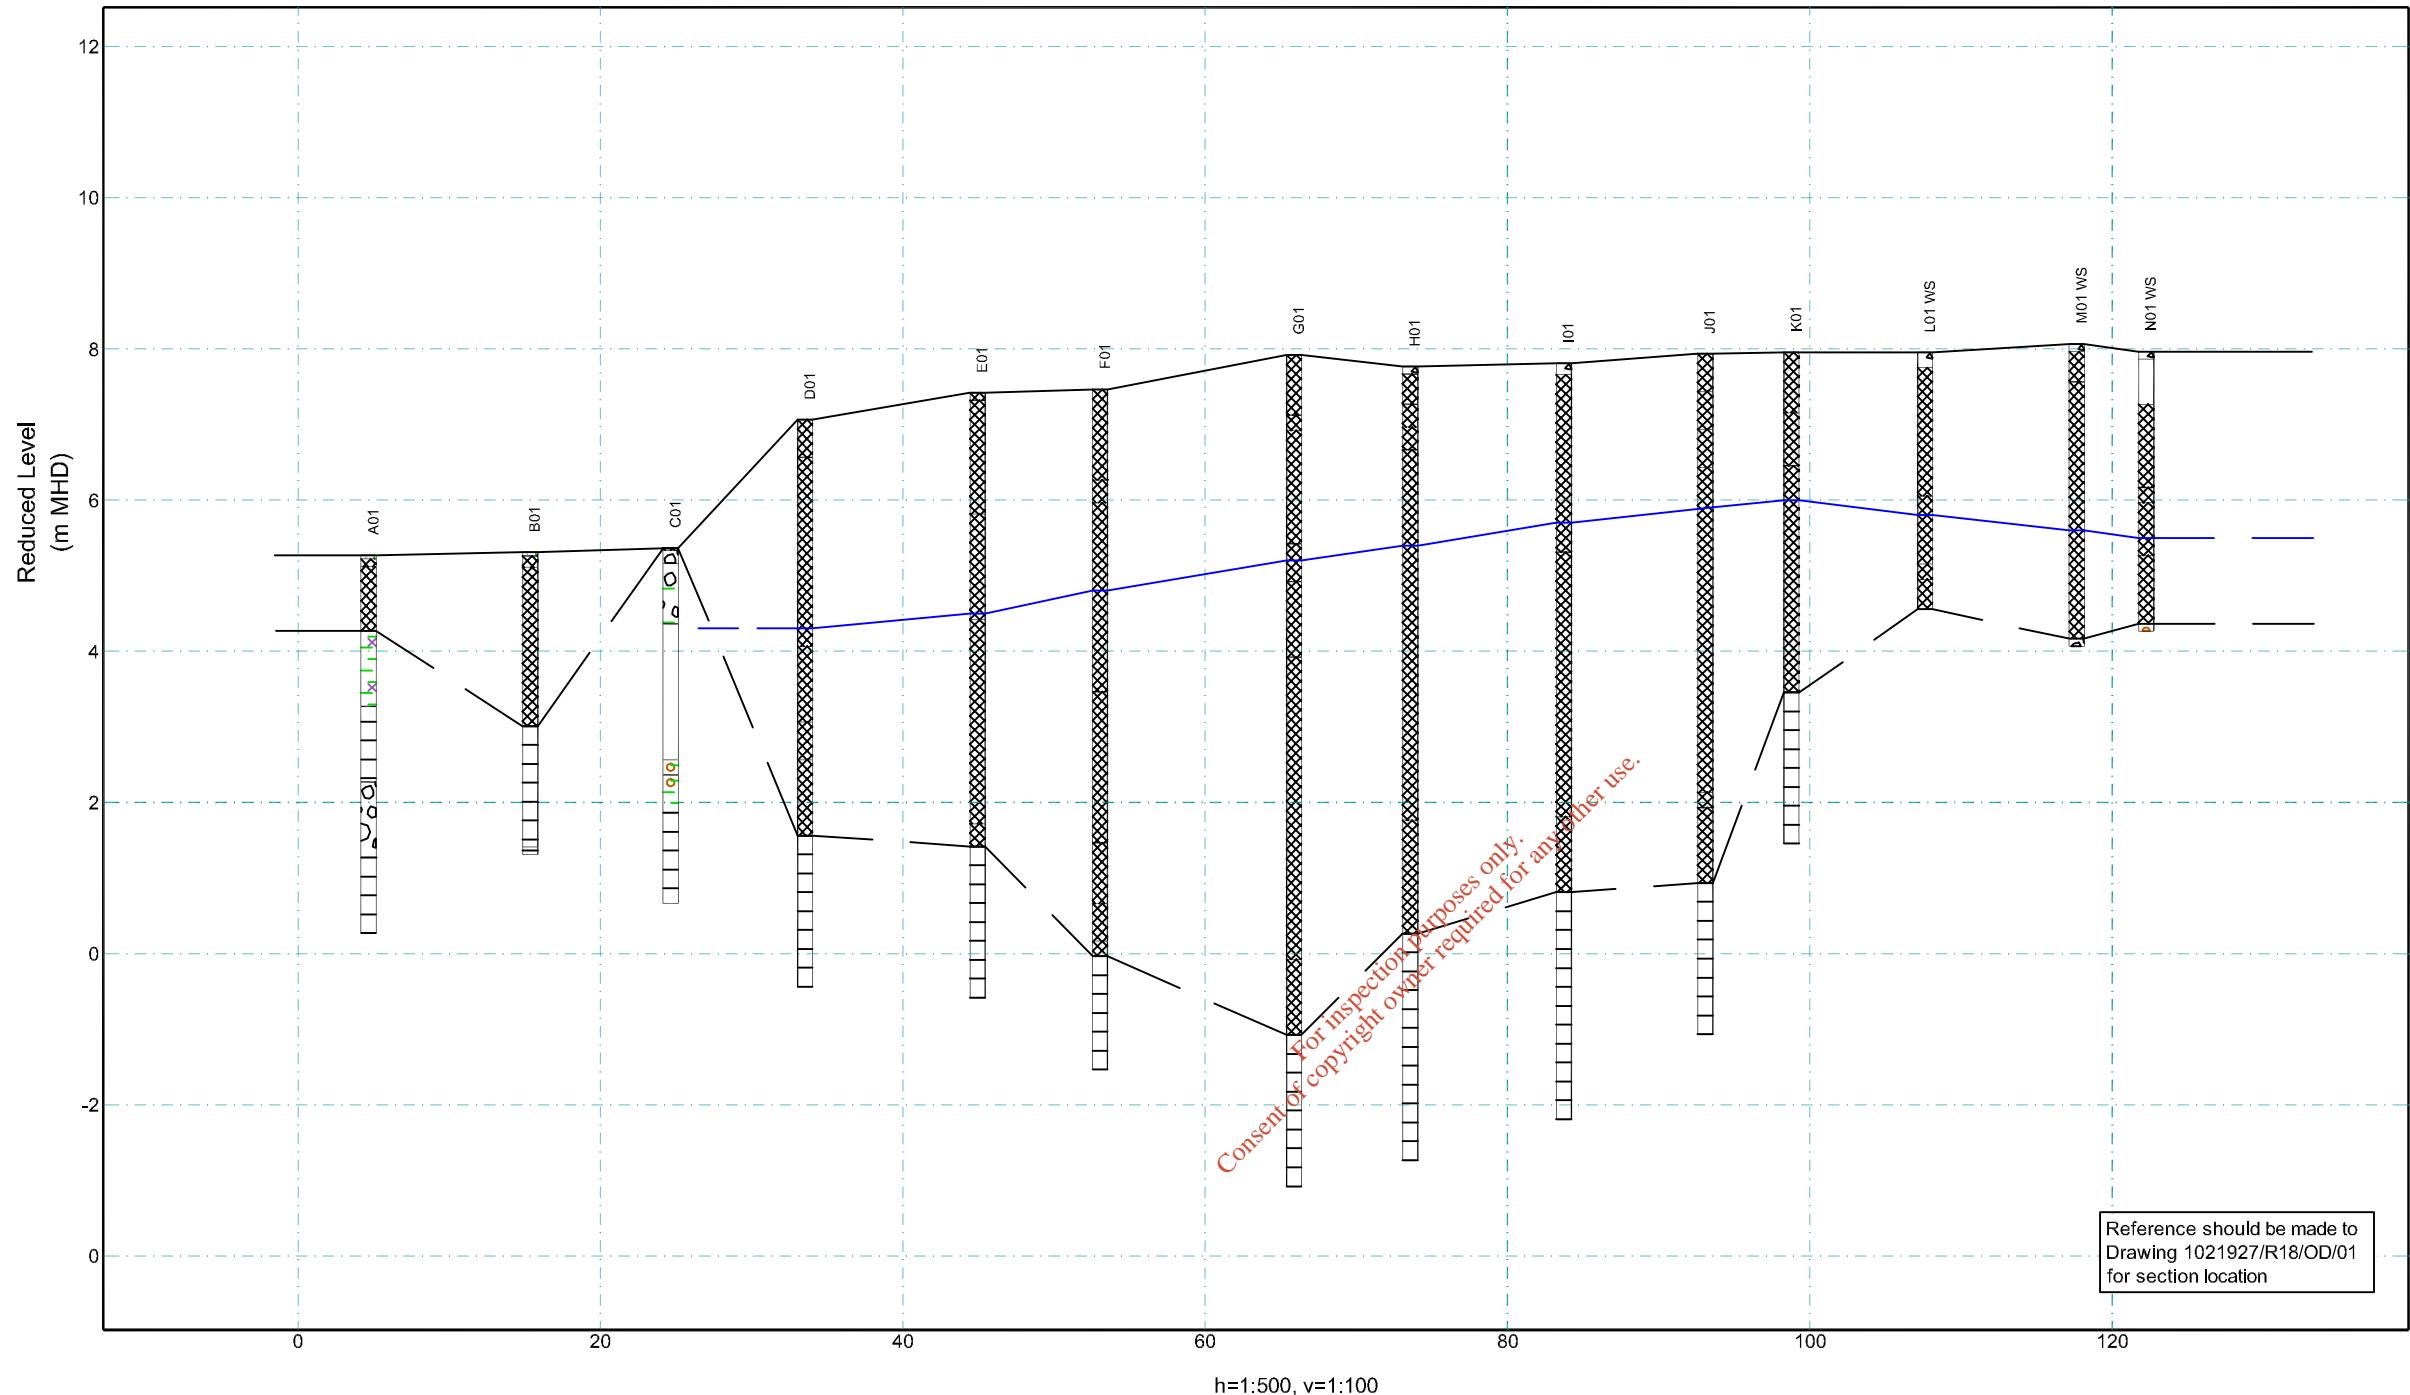

8.2 Recommendations

The following recommendation presented in the 2010 QRA Report is still considered to be valid.

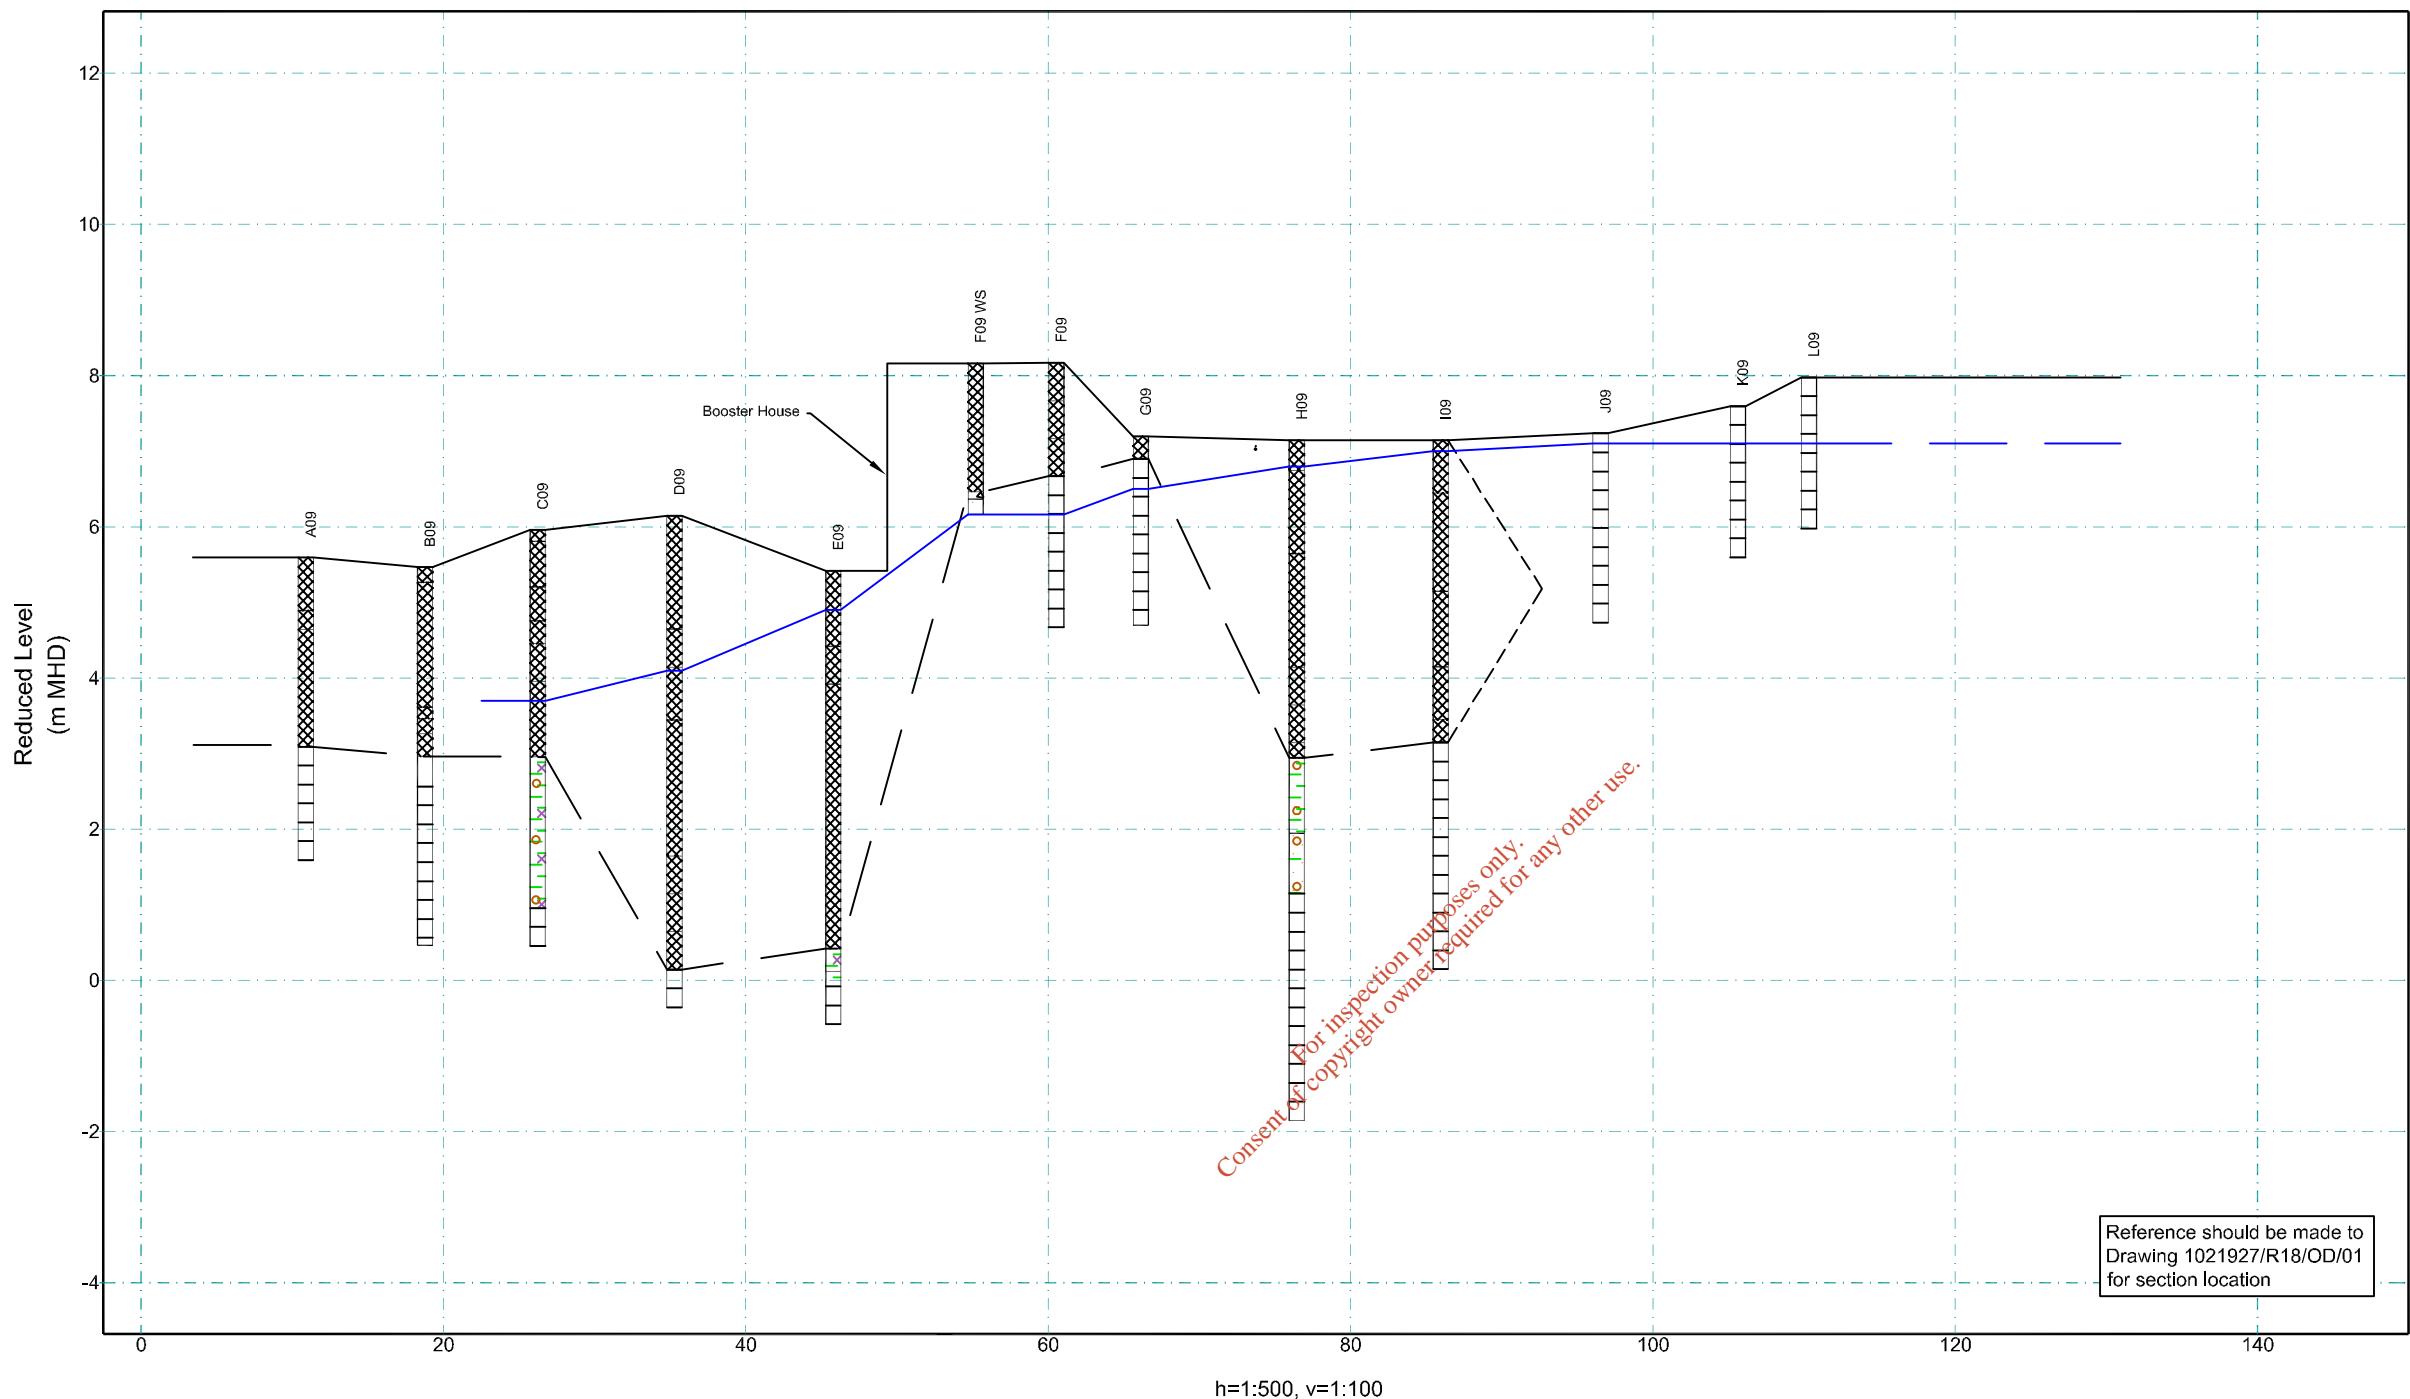

1. Undertake some further preparatory works on site prior to remediation works commencing. These include:-
 - Demolition of the Governor House, Booster House and connecting internal walls.
 - Construction of a DRI (District Regulator Installation) together with the relocation of the ESB sub-station near the boundary with O'Curry Street. Some preparatory works may be required at these locations.

Obtaining large bulk samples of contaminated soils to undertake bench trials to allow selection of an appropriate binder for the stabilisation/ solidification works will be undertaken as part of the Phase 2 remediation pilot works.

Aliphatic C5-C12 Concentration (mg/kg)

This plot was produced using data obtained from the 2009 & 2011 Site Investigations. No data was included from the previous investigations. Where more than one sample was obtained from a hole the highest concentration for that location was used to produce the plot.

Contours were plotted using the Kriging method based upon a 1m x 1m grid
