

Attachment J.1 Accident Prevention & Emergency Response

The potential for unauthorised or unexpected releases to the environment is considered to be confined to incidents, such as fuel spill or a fire. The facility design incorporates measures to contain and allow effective clean up of fuel spills and leaks. Further information on the contingency measures that are and will be provided are presented in Section 5.9 of the EIS that accompanies this application.

The facility is certified to ISO 14001 Environmental Management System which includes an Emergency Response Procedure. The procedure ensures a rapid response to any incident by trained staff and minimises the potential impact on the environment of any associated emissions.
