Annual Environmental Report 2015

Agglomeration Name:	**Cork City**
Licence Register No.	**D0033-01**

Table of Contents

Section 1. Executive Summary and Introduction to the 2015 AER

1.1 Summary report on 2015

1. This Annual Environmental Report has been prepared for D0033-01, Cork City, in accordance with the requirements of the wastewater discharge licence for the agglomeration. There are no outstanding specified assessments for 2015, but comment and reviews are included in the AER as follows:

   - Priority Substances Assessment : Appendix 7.5 Results of selective testing

2. The Agglomeration is served by a wastewater treatment plant at Carrigrennan Little Island with a Design PE of 413,200. The works consists of essentially two treatment activities, namely Wastewater Treatment and Solids Treatment.

   The Wastewater Treatment process includes the following:-
   - Screening (5mm) and De-gritting: Local flows only,- flows from City previously screened and de-gritted at Ballinure Header Chamber.
   - InFlow Measurement & Sampling
   - Storm Water Treatment: 4 Tanks (storage/settlement/return/overflow)
   - Pre-Aeration, with odour control treatment of removed gases
   - Primary Clarification: 2 Settlement Tanks, (covered) sedimentation/ removal of settable solids
   - Secondary Treatment: Sequencing Batch Reactor, 8 Rectangular basins
   - OutFlow Measurement & Sampling
   - Effluent Discharge

   The Solids Treatment process includes the following:-
   - Sludge Treatment
   - Thickening
   - Digestion
   - Dewatering and Drying

   The sludge is anaerobically digested during which Biogas is produced. This Biogas is used on site to mix the sludge in the digestors, heat the sludge as it is re-circulated, and pasteurise and dry the sludge to 90% dry solids. The Sludge contains 5% Nitrogen, 5% Phosphorous and it has no significant heavy metals making it ideal for agricultural use.

3. The final effluent from the Primary Discharge Point was non- Compliant with the Emission Limit Values in 2015.

   The following parameters exceeded the emission limit values in 2015:-
   - Total Nitrogen
   - Total Phosphorus

4. 2,670,600 kgs sludge (as kgs dry solids) were removed from the wastewater treatment plant in 2015. 867,700 kgs, (total offsite weight), was as dewatered digested sludge wetcake (Biocake) while 2,712,000 kg (total offsite weight), was as the dried biosolid granule product Biogrow. All thermally treated granules (biogrow) are exported for controlled use as a fertilizer on

agriculture. Digested Sludge which is dewatered only, i.e. wetcake (Biocake) is treated to a class A standard before being utilised in a similar manner. All Sludge products were transferred for use in agriculture via a secure and tightly controlled system .

5. There were no major capital or operational changes, undertaken in 2015.

An Annual Statement of Measures is included in **Appendix 7.1.**

Section 2. Monitoring Reports Summary

2.1 Summary report on monthly influent monitoring

Table 2.1 - Influent Monitoring Summary

	BOD	COD	TSS	TP	TN	Hydraulic Loading	Organic Loading
	mg/l	mg/l	mg/l	mg/l	mg/l	m3/d	PE/day
Number of Samples	260	261	261	28	28	365	260
Annual Max.	330.0	1,500	490	6.40	40.0	238,997	513,667
Annual Mean	151.0	374	179	3.35	26.57	109,053	250,011
					Flow Weighted Annual Mean PE		

Significance of results
The annual mean hydraulic loading is less than the Treatment Plant Capacity as detailed further in Section 3.2.

The annual maximum hydraulic loading is less than the Treatment Plant Capacity as detailed further in Section 3.2.

The annual maximum organic loading is greater than the Treatment Plant Capacity as detailed further in Section 3.2.

The annual mean organic loading is less than the Treatment Plant Capacity as detailed further in Section 3.2.

The plant is able to meet peak loads.

A detailed discussion of I**nfluent** and **Effluent** issues, quantity, quality and impacts are outlined in **Appendix 7.1A** ***Influent & Effluent Monitoring.*** The impacts of rainfall, tidal infiltration and compliance with UWWT standards are tabulated together with historic data to demonstrate the evolution of the inflows and discharges since the construction of the WWTP.

2.2 Discharges from the agglomeration

Table 2.2 - Effluent Monitoring Summary

D0033-01 Licence Compliance												
2015	Flow	pH	cBOD	COD	Suspended Solids	Total N (as N)	TON (as N)	Total Ammonia (as N)	Total P (as P)	Orthophosphate (as P)	Visual Inspection	Comments
	m3/d	units	(mg/L)	(mg/L)	(mg/L)	(mg/L)	(mg/L)	(mg/L)	(mg/L)	(mg/L)		
WWDL ELV (Schedule A)	N/A	6-9	25	125	35	10**	N/A	N/A	2.5**	N/A	N/A	** Annual Mean
WWDL ELV with Condition 2 interpretation included, (Composite samples)	N/A	6-9	50	250	87.5	12	N/A	N/A	3.0	N/A	N/A	
8 out of 10 samples, < or = ELV	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	
No. of samples required by licence, B.1	Continuous	Daily	26	26	26	26	26	26	26	26	Daily	
No. of Samples Taken	365	264	262	264	264	28	26	26	28	26	264

No.sample results above WWDL ELV	N/A	**0**	**5**	**4**	**9**	N/A	N/A	N/A	N/A	N/A	N/A	
No Samples above WWDL ELV with condition 2 interpretation included	N/A	0	0	0	0	**25**	N/A	N/A	**4**	N/A	N/A	
8 out of 10 samples, < or = ELV	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	Condition removed from Total N & P in Tech. Amendment June 2014
Annual Mean (For Parameters where a mean ELV applies)	N/A	N/A	N/A	N/A	N/A	**19.93***	N/A	N/A	**2.09***	N/A	N/A	* Flow Weighted Annual Mean
Overall Compliance	Pass	Pass	Pass	Pass	Pass	Fail	N/A	N/A	Fail**	N/A	N/A	**Exceeded no. of samples above 120%ELV

Significance of results

The WWTP was non-compliant with the ELV's set in the wastewater discharge licence for Total Nitrogen and Total Phosphorus. The Annual Mean for Total Nitrogen exceeded the emission limit value and 25 individual samples also exceeded the emission limit value by more than 20%. In contrast, the annual mean for Total Phosphorus was in compliance with the ELV but 4 individual samples exceeded the ELV by more than 20% when the allowable number was 3 samples. Non-compliance is due to the WWTP not being designed for Nutrient Removal. The impact on receiving waters is assessed further in Section 2.3.

2.3 Ambient monitoring summary

Table 2.3A - Ambient River Monitoring Report Summary

Ambient Monitoring Point from WWDL (or as agreed with EPA)	Irish Grid Reference Easting:	Northing:	EPA Feature Coding Tool Code	Current EQS Status (Extrapolated)	Does assessment of the ambient monitoring results indicate that the discharge is impacting on water quality Yes/No, List impact(s) for each Yes answer	Comment
M01 Curraheen Road Bridge	162,843	69,176	RS19T050890	Poor	No	Upstream of any city discharge
M02 Carrigrohane Bridge	162,863	71,034	RS19C120110	Poor	No	
M03 County Hall	165,003	71,212	RS19C120740	Poor	Yes -See below, Curraheen River	
M04 Bandon Road	164,101	68,782	RS19G040140	Poor	No	Upstream of any city discharge
M05 Woodhaven Estate	164,344	69,415	RS19G040190	Poor	No / slight	
M06 GLASHEEN (Cork City) - Sandbrook Estate	165,278	69,503	RS19G040300	Poor	Yes -See below, Glasheen River	
M07 Clashduv Road	165,697	70,336	RS19G040490	Poor	Yes -See below, Glasheen River	
M08 Glasheen Bridge	165,401	70,768	RS19G040700	Poor	Yes -See below, Glasheen River	
M09 Blackstone Bridge	165,691	74,463	RS19B140110	Moderate *	No	Upstream of any city discharge
M10 Kilnap	166,291	74,796	RS19G880990	Moderate *	No	Upstream of any city discharge

M12 Blackpool (Bride RS19B14)	167,422	73,340	RS19B140800	Moderate *	No	
M13 Glen Rec. Park	168,942	73,453	RS19G090400	Moderate *	Yes-See below, Glen River	
M14 Spring Lane	167,868	73,539	RS19G090800	Moderate *	No	
M15 leitrim Street (Bride(RS19B14)	167,496	72,342	RS19K750900	N/Q	Yes- See below, Kiln River	
All river monitoring was carried out in the same locations in 2015 as previous years						
* Good -EPA 2011						

The results for the Network River Monitoring are included in **Appendix 7.2 .**

Significance of results

There are no ELV's set in the discharge Licence, D0033-01, with respect to Network discharges.

Discharges from the wastewater network have a possible observable negative impact on the River water quality status as discussed in detail in **Appendix 7.2**.

Table 2.3B - Ambient Transitional and Coastal Waters Monitoring Report Summary

Ambient Monitoring Point from WWDL (or as agreed with EPA)	Irish Grid Reference Easting:	Irish Grid Reference Northing:	EPA Feature Coding Tool Code	Current Trophic/ EQS Status	Does assessment of the ambient monitoring results indicate that the discharge is impacting on water quality Yes/No, List impact(s) for each Yes answer	Comment
C9 Tivoli	170,242	72,195	TW04003159LE2006	Intermediate / Moderate	No	Water Quality is improving in Estuary since construction of WWTP
C7 Blackrock Castle	172,537	72,182	TW04003159LE2005	Intermediate / Moderate	No	
C8 Mid Lough Mahon	174,650	70,440	TW05003157LE4004	Intermediate / Moderate	No	
C6 End Lough Mahon	177,040	69,408	TW05003157LE4005	Intermediate / Moderate	No	
C5 Haulbowline	178,090	65,386	CW05003150LE8004	Unpolluted / Good	No	

The results for the Transitional and Coastal Waters Monitoring are included in **Appendix 7.2A** .

Significance of results

The WWTP was non-compliant with the ELV's set in the wastewater discharge licence for Total Nitrogen, and Total Phosphorus, as detailed in Section 2.2

The discharge from the Wastewater Treatment Plant does not have an observable negative impact on the water quality status. This is discussed in detail in **Appendix 7.2A**

2.4 Data collection and reporting requirements under the Urban Waste Water Treatment Directive

The electronic submission of WWTP Influent data to EDEN was completed on: 14th January 2016
The electronic submission of WWTP Effluent data to EDEN was completed on: 7th January 2016

Authorisation of data on EDEN was upgraded to include EPA on: 14th January 2016

The electronic submission of Ambient River Monitoring data, including EPA share authorisation, was completed on: 4th January 2016
The electronic submission of Ambient Harbour (Transitional and Coastal Waters) Monitoring data including EPA share authorisation, was completed on: 4th January 2016.

2.5 Pollutant Release and Transfer Register (PRTR) - report for previous year

The PRTR Report for 2015 was submitted to the EPA on 12th February 2016. This was verified as accepted by the EPA data system on 13th February 2016.

The following Notes are for Clarification in evaluating the 2015 PRTR Report and comparing it with the PRTR Report submitted for 2014 and previous years.

- Inflows and outflows to the site in 2015 were less than those of 2014, mainly due to patterns of rainfall in the catchment. Treated effluent quantities were reduced to 94.2% of 2014 quantities.
- Storm overflows in 2015 were half that of 2014 and more in line with previous years, 2013 and 2012.
- In 2015, in addition to using Toolset Version 5.0, testing was carried out on a suite of Priority Substance parameters that had been identified for further investigation after screening, as a follow on to the testing that had been done in 2014.
- There were a number of +/- 50% warnings from the PRTR workbook in the comparison to 2014 figures submitted, due to the decrease in quantities of storm overflows over 2014.
- There were also variations in test results over 2015 versus 2014 which are detailed more fully in the Priority Substance report in Appendix 7.5. There was a query regarding some results as Effluent results for PAH were in general higher than Influent results. This may be a reflection of the variation in the nature of the influent from day to day and the duration of the WWTP treatment process. NonylPhenol results were reported as less than LOD (LOD in 2015 6microg/l vs 0.6 microg/l in 2014). There was not sufficient confidence in the results to include these in the PRTR
- Number Employed: DBO: Northumbrian Water: Directly employed number is 21. This reduced to 20 for part of the year but was complemented with an additional contract employee. The number was restored to 21 by November 2015
- Diesel Usage was again reduced in 2015 over 2013 as it was not used at any time in 2015 to generate electricity under WPDRS whereas it had been used up to November in 2013.
- Normal sludge operations continued in 2015. The amount of Wetcake versus Biogrow Pellets produced in 2015 reduced to normal operational process proportions.
- While the majority of sludge is treated and dried into a clean pellet format (Biogrow) on the site, it is landspread for agricultural use offsite in Ireland, i.e. location of treatment is designated as “off-site in Ireland”
- Wet Cake and Dried Pellet quantities are shown separately on the Waste return.

A Copy of the 2015 PRTR report is included in **Appendix 7.3 – PRTR Summary Sheets**

Section 3 Operational Reports Summary

3.1 Treatment Efficiency Report

A summary presentation of the efficiency of the treatment process including information for all the parameters specified in the licence is included below:-

Table 3.1 - Treatment Efficiency Report Summary
Table 3.1A

2015	Flow M3	cBOD (Kg/yr)	COD (Kg/yr)	TSS (Kg/yr)	Total Phosphorus (Kg/yr)	Total Nitrogen (Kg/yr)	Comment
Influent Mass Loading (kg/year)	39,804,499	5,475,238	13,606,639	6,617,424	100,665	812,567	
Effluent Mass Emmission (kg/year)	42,251,970	496,887	3,038,716	733,909	88,517	816,792	Effluent Weir Flow Meter Vs influent Magno Flow Meters
% Efficiency (%reduction of Influent load)	-6.1%	90.9%	77.7%	88.9%	12.1%	-0.5%	

The main flows into the works are measured using electromagnetic flow meters, averaging the data from two meters operating in series. The outlet flows are measured using flumes. Influent flow data is taken to be more representative of the actual flow to the WWTP due to the better accuracy of the electromagnetic flow meters.

Table 3.1B
Figures as above but re-worked to correlate Inflow to Outflow

2015 Adjusted to Correlate Outflow To Inflow	Flow M3/day	cBOD (Kg/yr)	COD (Kg/yr)	TSS (Kg/yr)	Total Phosphorus (Kg/yr)	Total Nitrogen (Kg/yr)	Comment
Influent Mass Loading (kg/year)	39,804,499	5,475,238	13,606,639	6,617,424	100,665	812,567	
Effluent Mass Emmission (kg/year)	39,804,499	468,105	2,862,697	691,397	83,390	769,479	Outflow reduced prorata to match inflow
% Efficiency (%reduction of Influent load)	0.0%	91.5%	79.0%	89.6%	17.2%	5.3%	

3.2 Treatment Capacity Report

Table 3.2 - Treatment Capacity Report Summary

2015	M3 / day	M3 / year	Comment
Hydraulic Capacity- Design / As Constructed -DWF	59,359	21,666,035	Multiple of Daily Figure
Hydraulic Capacity- Design / As Constructed Peak Flow	359,592	131,251,080	
Hydraulic Capacity- Current Loading -Dry Weather Flow	77,295	28,212,675	
Hydraulic Capacity- Current Loading - Average Daily Flow to Treatment	111,639	40,748,235	Design based on Daily figures not Yearly
Hydraulic Capacity- Peak Flow	238,997	87,233,905	
Hydraulic Capacity- Remaining DWF	- 17,936	- 6,546,640	
Hydraulic Capacity- Remaining Peak Flow	120,595	44,017,175	
Will the Hydraulic Capacity be exceeded in the next 3 years	Yes		DWF
	No		Peak

77,295m3/day is estimated/calculated DWF 2015.

2015	PE	Comment
Organic Capacity- Design / As Constructed (PE)	413,200	
Organic Capacity- Current Loading (PE) - Annual Mean (Flow Related)	250,011	
Organic Capacity- Current Loading (PE) - Max. Average Weekly Load	358,852	**
Organic Capacity- Remaining (PE)	163,189	Note: using Annual Mean
Will the Organic Capacity be exceeded in the next 3 years	No	

3.3 Extent of Agglomeration Summary Report

In this section Irish Water is required to report on the amount of urban waste water generated within the agglomeration. It does not include any waste water collected and treated in a private system and discharged to water under a Section 4 Licence issued under the Water Pollution Acts 1977 (as amended):

Table 3.3 - Extent of Agglomeration Summary Report

2015	City	County	% of PE Load Generated in the Agglomeration	% of PE Load Collected in the Sewer Network	Note
Total Load Generated in the Agglomeration	64.4%	35.6%	100%		
Load Generated in the Agglomeration that is Collected in the Sewer Network	99.69%	98.1%	99.1%		
Load Generated in the Agglomeration that is Collected in the Sewer Network	64.8%	35.2%		100.0%	
Load Collected in the Sewer Network but discharged through SWO,EO***	12.73%	2.0%	**8.87%**	**8.95%**	A
Load Collected in the Agglomeration that enters the Treatment Plant			90.26%	91.05%	B
Load that enters the treatment Plant that is treated to Secondary Level	99.30%				
Load Collected in the Agglomeration that is treated to Secondary Treatment Level			89.6%	90.41%	
Load entering the Treatment Plant that is discharged through Storm Overflow, i.e. After primary/ preliminary treatment	0.70%		**0.64%**	**0.64%**	C = Storm BOD Vs Influent BOD
Load Collected in the Sewer Network but discharged without treatment (or with Primary/Preliminary Treatment only)			**9.51%**	**9.59%**	A + C

*** Estimate only as no Network Hydraulic Model or CSO monitoring available currently

Load generated in the agglomeration that is collected in the sewer network is the total load generated and collected in the municipal network within the boundary of the agglomeration.

Load collected in the agglomeration that enters treatment plant is that portion of the previous figure which enters the waste water treatment plant

Load collected but discharged without treatment is that portion of the first figure which is discharged without treatment**.**

The data in Table 3.3 above is based on influent monitoring as detailed in Section 2.1 above and **Appendix 7.1A.**

3.4 Complaints Summary

A summary of complaints of an environmental nature is included below.

Table 3.4 – WWTP Complaints Summary Table:

Table 3.4 - Complaints Summary Table:

Number	Date & Time	Nature of Complaint	Cause of Complaint	Actions taken to resolve issue	Closed (Y/N)
None					

There were no complaints relating to discharges.

3.5 Reported Incidents Summary

A summary of reported incidents is included below.

Table 3.5.1 - Summary of Incidents

Incident Type	Incident Description	Cause	No.Of Incidents	Corrective Action	Authorities contacted	Reported to EPA	Closed	EPA Ref
Non-Compliance	ELV exceedences for Total Phosphorous and Total Nitrogen	Plant not designed for Nutrient Removal	1, Ongoing	PR for upgrade Prepared, Review Characterisation of Harbour carried out and presented to EPA. Awaiting DECLG decision regarding de-designation or otherwise of Lough Mahon.	No	Yes, Quarterly reports via EDEN	No	INCI000092
Spillage	Overflow from sewer	Temporary use of undersized sewer due to substandard drainage from Housing Estate not Taken in Charge	1	Public Sewer repaired, Overflow cleaned up, Awaiting remediation of estate sewer by receiver	Yes	Yes	No	INCI006507
Uncontrolled Release	Back up of sewage in drains and flooding of property	Pump Station unable to cope with inflows due to unprecedented rainfall	1	Increased pumping to maximum, used suction tanker to clean spill and used portable pump to prevent flooding to properties	Yes (L.A.)	Yes	No	INCI009446
Uncontrolled Release	Overflow from sewer	Blocked sewer was surcharged and when released overflowed to paved areas adjacent to houses and near underfloor vents.	1	Used Suction tanker to clean spill and wash down paved areas	Yes (L.A.)	Yes	No	INCI009448

Table 3.5.2 - Summary of Overall Incidents

No. of Incidents in 2015	4
No of Incidents reported to the EPA via EDEN in 2015	4
Explanation of any discrepancies between the two numbers above	N/A

3.6 Sludge / Other inputs to the WWTP

'Other inputs' to the waste water treatment plant are summarised in Table 3.6 below.

Table 3.6 - Other Inputs

Input type	m3/year	PE/year	% of load to WWTP	Is there a leachate/sludge acceptance procedure for the WWTP? (Y/N)	Is there a dedicated leachate/sludge acceptance facility for the WWTP? (Y/N)
Domestic /Septic Tank Sludge	0	0	0	N/A	N
Industrial / Commercial Sludge	0	0	0	N/A	N
Landfill Leachate (delivered by tanker)	0	0	0	N/A	N
Landfill Leachate (delivered by sewer network)	98,369	60,305	0.09%	Y*	N
		(165 PE/day)			
Other (specify)	0	0	0	N/A	N

Notes:

1. Other Inputs include; septic tank sludge, industrial /commercial sludge, landfill leachate and any other sludge that is collected and added to the treatment plant.
2. Sludge that is added to a dedicated sludge reception facility at a waste water treatment plant not included in Table 3.6. Only include sludge which is added to the waste water treatment process stream. Enter zero where there are no inputs

Note: *Discharge to WWTP is via Sewer network only, in accordance with a Discharge to Sewer Licence.

Section 4. Infrastructural Assessments and Programme of Improvements

4.1 Storm water overflow identification and inspection report

A detailed Storm Water Overflow Identification & Inspection report was included in the **2013 AER**. There have been no changes to the Storm Water overflows included in the 2013 report.

The SWO assessment submitted in the **2013 AER** identified that one Storm Water Overflow submitted in the original application list, Table B.5, has been eliminated, and there are 8 further Storm Water Overflows that were not identified as such in the Licence Application. These will be addressed by Technical Amendment application to be submitted by Irish Water.

There is no monitoring equipment installed at the Combined Sewer Overflow Structures (CSOs) to determine the number of times each is activated, the volume discharged or the percentage of the total effluent generated at each CSO which is discharged. At pump Stations metered data was utilised where available or alternately pump run hours were used to calculate flows

A detailed study was carried out on the Drainage Network GIS Records to produce catchment mapping for each CSO. This information was fed into the Assessment report and was very informative in carrying out the assessment. However, in order to produce data of the kind requested, short of installing equipment at each CSO and monitoring same, it would be necessary to model the full drainage network itself. The Network GIS system is not adequate for this at this time.

Project

Irish Water is progressing with a Drainage Area Plan (DAP) for the Agglomeration, with a view to constructing a model of the network. Tendering for Consultants to construct and validate the model is nearing completion. The Consultant will be appointed in Q2 2016. The outputs from this model will quantify the overflows from each Storm Water Overflow and hence verify if they are problematic or not.

Table 4.2.3 - Sewer Integrity Risk Assessment Tool Summary

The Improvement Programme should include an assessment of the integrity of the existing wastewater works for the following:	**Risk Assessment Rating (High, Medium, Low)**	**Risk Assessment Score**	**Reference to relevant Section of AER** (e.g.Appendix 2 Section 4)	**Specified Improvements**	**Comment**
Hydraulic Risk Assessment Score	*High Risk*	*140*	*AER Section 4.2*	*DAP under Tender, Start Q1 2016*	*Agglomeration does not have a Hydraulic Model*
Environmental Risk Assessment Score	*Low Risk*	*248*		*DAP will inform*	*Good Data available, Compliance of Storm Overflows Required*
Structural Risk Assessment Score	*Medium Risk*	*95.32*		*DAP will inform*	*Large Network, Small percentage CCTVs Vs Total length of Network*
Operation & Maintenance Risk Assessment Score	*Medium Risk*	*125*	*AER Section 4.2 & Appendix 7.1*	*Upgrade to Atlantic Pond PS, Suppressed Capital Maintenance*	*Large Network equates values at highest end of scale*
Overall Risk Score for the agglomeration	*High Risk*	*608.32*			
Comment where score from tool is not considered to be accurate reflection of reality					

Issues with the Sewer Integrity Tool / Agglomeration Details section prohibited input of extensive data for Storm Overflows. This information was previously submitted as part of the Storm Water Overflow Assessment Report in 2014.

Section 5. Licence Specific Reports

Licence Specific Reports Summary Table

Licence Specific Report	Never Required by Condition 5 in Licence	Required in this AER or outstanding from previous AER	Included in this AER/Remains Outstanding	Reference to previous AER containing report or relevant section of this AER
Priority Substances Assessment	No	No	No	Appendix 7.7 2015: Report on monitoring for particular substances identified from assessment in 2012/3 AERs
Drinking Water Abstraction Point Risk Assessment	Yes	No	N/A	
Habitats Impact Assessment	Yes	No	N/A	
Shellfish Impact Assessment	No	No	No	Submitted 3rd AER 2012
Pearl Mussel Report	Yes	No	N/A	
Toxicity/Leachate Management	Yes	No	N/A	
Toxicity of the Final Effluent Report	No	No	No	Submitted 2nd AER 2011

Licence Specific Reports Summary of Findings

Licence Specific Report	Recommendations in Report	Summary of Recommendations in Report	Status of Recommendations
Priority Substances Assessment	(2012/3) Yes	Additional Annual Testing of four substances	Carried out
Drinking Water Abstraction Point Risk Assessment	N/A	No	N/A
Habitats Impact Assessment	N/A	No	N/A
Shellfish Impact Assessment	(2012) Yes	Update on progress of works required	Refer to 2014 AER Section 7.10
Pearl Mussel Report	N/A	No	N/A
Toxicity/Leachate Management	N/A	No	N/A
Toxicity of the Final Effluent Report	No	No	No

5.1 Priority Substances Assessment

Screening of the WWTP primary discharge effluent for organic compounds and metals (Priority Substances) is conditioned to be carried out within twelve months of the date of grant of licence, i.e. by 17th Dec 2010.

The Environmental Protection Agency undertook an Effluent Characterisation with consultants Mott MacDonald Ireland Ltd, and 88 pollutants, (including all the priority substances) were monitored on a quarterly basis at 11 WWTPs around Ireland, including Cork City WWTP. This study's objective was to determine which pollutants are likely to be found in Irish WWTPs and also to refine the UWW Calculation Tool for PRTR reporting purposes.

It was agreed with the EPA that Cork City did not have to carry out further sample testing for the Priority Substances, i.e. Organic Compounds and Metals, as this testing was included in the Effluent Characterisation monitoring for Cork City WWTP. The final report for this WWTP Characterisation was produced in July 2012.

A summary of the findings of the report with relevance to Carrigrennan WWTP was attached in **2012 AER Report as Appendix 1: Priority Substances.** The **2013 AER** reported on the requirement for a monitoring programme under paragraph 4.12 and schedule B1 note 3 of the licence.

Conclusion

The results of the WWTP Characterisation were reviewed against the Annual Average Environmental Quality Standard (AA-EQS) for Other Surface Waters as set out in Tables 10 to 12 in S.I No.272 of 2009 and as amended in S.I. No. 373 of 2012.

No impact on the Receiving Waters was identified from the substances tested.

The majority of parameters were below the Annual Average Environmental Quality Standard (AA-EQS) for Other Surface Waters as set out in Tables 10 to 12 in S.I No.272 of 2009 and as amended in S.I. No. 373 of 2012.

Overall it was considered that given the location of the outfall from the WWTP in the Lower Estuary there is adequate dilution for the concentration of substances where detected above the Annual Average Environmental Quality Standard.

From the review however, four substances are recommended to be tested on an annual basis to verify that there is no deterioration in effluent quality.

1) **Cyanide** presented as exceeding the AA-EQS (Other) in two samples of effluent of four tested at levels of 22 and 16, Vs standard of 10microgramme/litre.
2)**Zinc** had one exceedance at 45.5microgramme/litre Vs AA-EQS (Other) standard of 40 microgramme/ litre.
3) **Nonylphenol and Nonylphenol Ethoxylates** (NP/NPEs) had one test value of the four above the AA-EQS (Other) standard of 0.3microgramme/litre. This test result was however at a level of 3.65 microgramme /litre which warrants further test, in particular given the type of industries adjacent to the WWTP.
4)**Di(2-ethylexyl)phthalate** had all four test values below the AA-EQS (Other) standard of 1.3microgramme/litre, the highest test value coming in at 1.11microgramme/litre. It is close enough to the standard to warrant retest on an annual basis in conjunction with the other three substances above.

Monitoring 2015:

Samples were collected and tested in November 2015 from the influent and Effluent at the WWTP. These samples were tested for **Zinc, Glyphosate, PAHs, Nonylphenols** and **DEHP**. The Results are discussed, compared to results for 2014 and tabulated in Appendix 7.5 and Table 7.7.1 of the appendix respectively.

5.2 Drinking Water Abstraction Point Risk Assessment.

This assessment is not required for D0033-01 Cork City

5.3 Shellfish Impact Assessment Report.

The Cork City scheme is currently being reviewed and part of the review will include an assessment of nutrient removal requirements and impacts on shellfish waters. A shellfish assessment was undertaken by Cork City Council and submitted to the EPA as part of the 2012 Annual Environmental Report. This report is currently being reviewed. It is proposed to undertake a review of the dispersion modelling of the discharge from Carrigrennan to assess potential impacts of the discharge from the wastewater treatment plant. The 2017-2021 investment plan includes a proposal to provide UV treatment at Carrigrennan if the updated discharge modelling shows that it is necessary to protect the shellfish water quality. The 2017-2021 investment plan also includes a proposal to provide nutrient removal at Carrigrennan.

5.4 Toxicity / Leachate Management

There is no specific condition in the D0033-01 licence concerning Landfill Leachate.

Leachate from the Kinsale Road Landfill site is discharged directly to the sewer network (City) on a daily basis. During 2015, 98,369 m3 in total was discharged to the sewer, making up **0.247%** of the total influent to the WWTP, a little less than the equivalent of one day's intake overall.

The leachate is quite weak in strength, typifying that of an older landfill. The P.E. per day in 2015 was 165 or **0.066%** of daily load.

5.5 Toxicity of the Final Effluent Report

A full Toxicity report was included as part of the second **AER Report 2011**

5.6 Pearl Mussel Measures Report

This assessment is not required for D0033-01 Cork City

5.7 Habitats Impact Assessment Report

This assessment is not required for D0033-01 Cork City

Section 6. Certification and Sign Off

Table 6.1 - Summary of AER Contents

Does the AER include an executive summary?	Yes
Does the AER include an assessment of the performance of the Waste Water Works (i.e. have the results of assessments been interpreted against WWDL requirements and or Environmental Quality Standards)?	Yes
Is there a need to advise the EPA for consideration of a technical amendment / review of the licence?	Yes
List reason **SWO eliminated** **Additional SWOs identified** **Secondary Discharges to Kiln River**	 1 No. 8 No.
Is there a need to request/advise the EPA of any modifications to the existing WWDL? Refer to Condition 1.7 (changes to works/discharges) & Condition 4 (changes to monitoring location, frequency etc.)	As above
List reason e.g. failure to complete specified works within dates specified in the licence, changes to monitoring requirements *(insert lines as required)*	N/A
Have these processes commenced? (i.e. Request for Technical Amendment / Licence Review / Change Request)	IW to progress
Are all outstanding reports and assessments from previous AERs included as an appendix to this AER?	N/A
List outstanding reports *(insert lines as required)*	None

Declaration by Irish Water

The AER contains the following;

- Introduction and background to 2015 AER
- Monitoring reports summary.
- Operational reports summary.
- Infrastructural Assessment and Programme of Improvements.
- Licence specific reports.
- Certification and Sign Off
- Appendices

I certify that to the best of my knowledge the information given in this Annual Environmental Report is truthful, accurate and complete:

Signed:  Date: 10/03/16

Gerry Galvin
Chief Technical Advisor

Appendix 7.4 – Sewer integrity tool output

Appendix 7.5 – Specified Improvement Programme

Appendix 7.6 - Priority Substances Assessment: Monitoring Review

Appendix 7.1 - Annual Statement of Measures

Statement of Measures

Cork City Council and Cork County Council operate under a Service Level Agreement as agents of Irish Water to operate the Network, pump Stations and Waste Water Treatment Plant for the Cork City Agglomeration.

WWTP

The Cork City Waste Water Treatment plant at Carrigrennan is operated by Northumbrian Water Projects Ltd on behalf of Consort Joint Venture on a twenty year contract, novated to Irish Water, from 2004. Full Performance Management Systems, independently certified to ISO 9001 and ISO 14001, are in place, with appropriate controls and monitoring for the operation, and maintenance of the plant and equipment. Carrigrennan WWTP is operated to the highest standards for secondary treatment of effluent and all environmental monitoring required by the licence is undertaken. Process monitoring is also undertaken and alarm and call-out systems are in place to address any accidents/incidents should they arise.

The proposed upgrade of the WWTP to meet Tertiary Treatment Standards is on temporary hold, pending the decision or otherwise of the DoECLG to de-designate Lough Mahon Estuary. Works associated with shellfish impacts will be considered in line with the other WWTP upgrade proposals.

Network

Atlantic Pond Pump Station and the Ballinure Header Chamber are the key items of infrastructure on the system apart from the Treatment Plant. They are operated and maintained under separate contract, and are under constant surveillance. A review is underway by Irish Water since late 2014 of the operation of Ballinure Header Chamber and Atlantic Pond Pump Station. A contract to optimise equipment, e.g. by installing variable speed drives on pumps, etc., to be carried out in 2016 together with upgrade of controls and Scada/ Telemetry, that improvements will be achieved in flow regimes to the WWTP. This should assist in reducing peak flows and also reduce some overflows from the WWTP

Staff from Cork City Council plant and Machinery Dept. carries out maintenance of the older City pump stations, (pre Cork Main Drainage). The department operates a callout system for fitters and electricians. This call out system has been enhanced with the upgrade of all the control panels which includes a text alert system which is activated by alarm set points. The remaining pump stations, constructed more recently within the Cork Main Drainage projects are inspected regularly, up to twice weekly, depending on risk level attached to the installation, by City Council technicians. A maintenance programme is in place and service and repairs are carried out as required by contractors.

Pump replacement and refurbishment is an ongoing feature of the preventive maintenance carried out under both systems. This results in any pump station failures being mitigated. Irish Water Programmes for *like for like* replacement of pumps and equipment, i.e. Suppressed Capital Maintenance programme have been utilised in 2015 and are targeted further in 2016. Repair, Replacement and upgrade of flow monitors and telemetry equipment are also being prioritised under these programmes.

Cork City Council on behalf of Irish Water operates and maintains the Drainage Network within the City. Regular inspection, repair and maintenance are carried out by the Drainage maintenance staff, responding to all complaints that are received from Irish Water concerning the network operation. A specialist crew inspects and cleans all Combined Sewer Overflows on a fortnightly basis. Cork City Council on behalf of Irish Water also operates a call-out /emergency response system for out- of- hour's problems that arise.

Cork County Council on behalf of Irish Water via their Area Network Maintenance Divisions, operate and maintain the County Council Drainage Network which discharges to Carrigrennan WWTP.

Appendix 7.1A – Influent & Effluent Monitoring Incl. UWWT Compliances

Table of Contents

Monitoring Reports Summary: Detailed

Summary Report on Monthly Influent Monitoring

Flows

Influent and effluent flow is measured on a continuous daily basis at the plant. Summary flow statistics on the influent to and effluent from the plant during 2015 based on the 365 (daily) flow measurements are tabulated below.

Total influent data represents influent water from the agglomeration arriving at the Carrigrennan Waste Water Treatment Plant. It does not include wastewater lost in combined sewer overflows in the upstream waste water works of the agglomeration.

Month	Inflow to Primary Tanks	Inflow to Storm Tanks	Total Inflow	Dischage to Effluent Outfall	Storm Tank Overflow to Storm Outfall	Total Discharge	2015 Rainfall	30 year Mean Rainfall (1981-2010)

Comments:

The discrepancy between inflow measured compared to discharge is a reflection of the method of flow measurement employed at the respective measurement locations. Discharges from the site are measured via Flume readings. The readings from two Mag. Flow meters in sequence are averaged and combined with a flume meter to the Storm overflow Tanks to calculate the inflow.

Outflows as measured by *Storm Tank overflow to Storm Outfall* (1,503,880m3 Total for 2015) are not directly comparable to the Inflows measured by *Inflow to Storm Tanks* (765,770 m3 for 2015) which is included as part of Total Inflow in Summary Table above. As part of the treatment process, overflows after Primary Treatment, i.e. over and above 1.83m3/sec, also flow to the Storm Tanks adding to the quantities that make up the outflows and similarly as flows vary/decrease over a time period, additional storm water will be added back into the effluent going for secondary treatment.

Original Design Data for the Carrigrennan WWTP, based on 2020 figures is as follows:

2.1.1 Crude Sewage Flow (Excluding the returns)	M3/day	M3/Hr	M3/sec
Crude Sewage Dry Weather Flow (DWF)	59,359	2,473.3	0.687
Crude Sewage Maximum Flow (WWF)	359,592	14,983	4.16
Design Factor, WWF/ DWF	6.06		
2.1.2 Flow to Primary Treatment	M3/day	M3/Hr	M3/sec
DWF	59,359		
Multiplier	3		
Maximum Flow	178,077	7,420	2.06
Excess flows are diverted to Storm Tanks			
2.1.3 Flow to Secondary Treatment	M3/day	M3/Hr	M3/sec
DWF	59,359		
Multiplier	2.5		
Infiltration	9,741		
Maximum Flow (2.5*DWF+ I)	158,139	6,589	1.83
Excess flows are diverted to Storm Tanks			
2.1.4 Annual Average Peak Flow	M3/day	M3/Hr	M3/sec
DWF	59,359	2,473.3	0.687
The Average Daily Flow (ADF) is assumed to be 1.2 *DWF	71,231	2,968	0.824
Average Daily Flow Peak (ADFP) is assumed to be 1.6* ADF	**113,969**	4,749	1.319

Flow Capacity

Comparing the Maximum Daily flow in 2015 at 238,997 m3/day with the design maximum daily flow design flow 359,592 m3/day, the flow received at the WWTP in 2015, at 66.4%, is well within the total flow capacity of the plant. The maximum design flow to secondary treatment is 158,139m3/day but during 2015 the maximum treated was 175,350 m3/day measured at the discharge outfall. Over the year 96.44% of all effluent discharges underwent Secondary Treatment.

Dry Weather Flow, Rainfall, Infiltration & Tidal Influences

The maximum hydraulic flow to the Carrigrennan plant during 2015 was a factor of 3.42 times higher than the minimum flow. This quantifies the range of influent flows experienced in the plant, variations being caused mainly by inflow, surface water ingress after rainfall via the combined sewer systems in the agglomeration, and infiltration into the waste water network through various means, from groundwater and sea water ingress experienced at higher tides. The groundwater and tidal influence is most evident by the infiltration experienced in periods of dry weather.

The rainfall received in Cork in 2015, at 1447mm, was 18% greater than the 30 year mean for Cork of 1228mm. Compared to 2013 and 2012 however, which were both at or near the 30 year mean, the storm overflows from the WWTP were the same, i.e. 1,503,880 for 2015 compared to 1,553,510 in 2013 and 1,523,940 in 2012.

December 2015 was a period of exceptional rainfall, (300% of the 30 year mean for December) and accounted for over 78% of the volume of Stormwater overflows for the year. There was consistent rain, over a sustained period, which led to increased inflow and an overflow situation. Isolated rainfall events may not necessarily cause overflows as the capacity in the storm tanks may suffice and the storm water can be fed back for treatment. Due to low runoff conditions, moderate rainfall in a dry period may not result in overflows at the WWTP and this was the case for most of 2015.

Apart from the month of December, 2015, all things considered, was a quite favourable year for Stormwater Overflows.

Overall in 2015 there were only 74 days when there were overflows, while there were 268 days when there was rain. (97 rain free days). This compares to 107 overflow days and 266 days of rain respectively in 2014). There were however stormwater overflows on 29 of the 31 days of December 2015.

Graphs illustrated over, show the influence of rainfall on inflows to the plant, the increase in treated effluent, and the overflows during periods of high rainfall.

Definition for DWF :
“The average Daily flow during seven consecutive days without rain (excluding a period which includes public or local holidays) following seven days during which the rainfall did not exceed 0.25mm on any one day” (Ref. IWEM 1993)

There were no periods in 2015 which qualified under the above definition, but a period between, 20th June to 25th June 2015 was close to qualification. Analysis of inflows gave an average DWF of 76,700 m3/day. Calculation of the 10%ile of flow for the year which has correlated quite closely in the past, would have given an estimated DWF of 77,295m3/day. Both these figures are in the order of previous estimates of 78,000 m3/day.

Cork Main Drainage Theoretical DWF /Design flow for 2015 was 56,487m3/day, including 9,280m3/d estimated for infiltration. The estimated DWF of 77,295m3/day indicates there was excess infiltration into the network of **20,800** m3/day over and above the design estimated infiltration. This represents 37% over and above the DWF design flow.

The flows received at the WWTP are most likely reflecting the location of the City which is at the head of the Estuary. A good proportion of the city centre, is either land reclaimed from the original marsh at the mouth of the River Lee, is within the tidal range, or is surrounded or adjacent to water. The majority of sewers in the centre city were re-laid /separated during the Cork Main Drainage projects but questions arise as to the integrity of the older drain connections to these new sewers.

Infiltration by tidal waters is reinforced by the varying levels of Chloride that have been measured in the inflows to the WWTP. These Chloride levels increase incrementally at times of higher tides, i.e. normally on a fortnightly basis, and are particularly noticeable at Spring and Neap tides. Excavations in the city centre have traditionally been tide-dependent, and in fact this was a feature of work programmes for Cork Main Drainage.

The drainage network in Cork City is composed of 54% of combined sewers versus 46% separated foul sewers. The inflows to the WWTP trend parallel to the trend of rainfall in the catchment, i.e. increasing at times of rainfall, see graph over, *Variation of Inflow with Rainfall*. This also highlights the relationship of storm overflow discharges to increase in rainfall.

The tidal/groundwater infiltration quantities received at the WWTP are steady and consistent, unlike storm inflows which are related to rainfall events in the catchment.

Summary Table of Yearly Flow Values

	Total Influent				Treated Effluent				Storm Overflow			Cork Airport

Influent Quality - Sampling

Influent samples are monitored on 5 out of each 7 days for each of the parameters COD, TSS and cBOD using a 24-hr composite sampler. Samples are collected from the composite sampler at 9.00 am each day, Monday to Friday. Results are as tested by the Accredited Laboratory on site

This information is presented in **2015 AER Table 2.1 Influent Monitoring Summary** and in more detail on page 11 of this Appendix in the Influent Monitoring -Monthly Summary Table. A total of 261 samples of influent were analysed during 2015 for COD and TSS and 259 for cBOD. Values given below are the Annual Maximum and Average (Mean).

Hydraulic inflows are measured daily, i.e. 365 flow readings for 2015, and again the results are as tabulated.

pH and Visual Inspection results were reported in 2015, in all 264 inspections were reported for the year.

A total of 28 samples each were monitored for Total N and Total P during 2015. The results of this monitoring is summarised in **2015 AER Table 2.1**.

Significance of Results

There was a minor reduction in strength of the inflow for 2015, i.e. the P.E equivalent was **250,011** with an inflow of 39,804,499 m3, compared to P.E. Equivalent of **250,784** for 2014, when there was a greater quantity of inflow of 43,642,816 m3. It also shows a reduction in P.E. Equivalent from **276,405** for 2013, **284,696** P.E. for 2012 and **302,842** P.E. for 2011. All these P.E. values were calculated similarly using daily flow weighted annual mean values.

The decrease in hydraulic inflow in 2015 over the previous year follows the rainfall pattern, i.e. is proposed as being mainly weather related.
The average daily values for COD, cBOD and TSS in **2015 AER Table 2.1 Influent Monitoring Summary** are representative of a medium to weak strength urban wastewater. Despite the proportion of industrial effluent included in the total composition which should increase the strength of the influent considerably, the average values monitored support the argument for large volumes of infiltration into the system, thereby weakening the resultant strength. The Annual Max COD value in 2015 was 1,500mg/l, comparable to the maximum of 1300mg/l experienced in 2013. That value was measured during the dry summer months and was reflective of industrial activity in the *local flows*.

Influent strength depends on discharges of wastewaters from the upstream agglomeration within any 24 hour sampling period. The 24 hour composite influent sewage quality is strongly influenced by rainfall, high tides and other infiltration prior to and during the sample collection period. The levels of Chloride measured give an indication of the level of influence of tidal inflows into the system. These chloride levels can be seen to fluctuate with the tides, having the largest values at times of the higher tides in particular. Months of high rainfall can show a dilution in the chloride concentrations

reflecting the different relative influences in proportion of infiltration. Chloride is included in table for reference.

There are "*Local Flows*" to Carrigrennan WWTP, comprised of inflows from the largely industrial area of Little Island. These are not the only industrial flows to the WWTP but they are identified and measured. The Local flows comprise of 8.9% of the total hydraulic inflow but produce 23.8% of the Total organic (BOD) loading of the plant, 21.1% of the COD loading and 14.6% of the Total Suspended Solids. At design it was estimated that Overall Industrial inputs, from the Area designated as "City" as well as the "Local" area would make up 52.85% of BOD loading, 50.85% of COD loading and 41.52% of TSS loading.

Leachate from the Kinsale Road Landfill site is discharged directly to the sewer network (City) on a daily basis. During 2015, 98,369 m3 in total was discharged to the sewer, making up 0.247% of the total influent to the WWTP, a little less than the equivalent of one day's intake overall. The leachate is quite weak in strength, typifying that of an older landfill. The P.E. /day from the Landfill in 2015 was 165.

Compliance with WWTP Design

cBOD, COD and TSS are within the Daily Design Loads for the WWTP.

Hydraulic Inflows exceed the Daily Design Load but are within the overall Total Design Capacity of the plant. 96.44 % of all discharges from the plant in 2015 underwent Secondary Treatment.

Carrigrennan WWTP is not designed for Nutrient Removal and is not capable of treating the Total Nitrogen loading received at the plant. While similarly not designed to treat Total Phosphorus, the loadings received are substantially reduced by the existing Secondary Treatment.

Mass Loading Measurement

		Full Flow Weighted Crude Sewage Loads to Site (inc storm)

Discharges from the Agglomeration

Effluent Quality -Sampling

Significance of Results

2015 AER Table 2.2 Effluent Monitoring Summary refers

Discharge Licence- Compliances

While there were individual results that were non-compliant, overall compliance was achieved for parameters **COD**, **cBOD**, and **Suspended Solids**.

4 tests for COD, and 5 tests for Suspended Solids exceeded the ELV but not the 120% ELV.

pH values were within a range of 7.0 minimum to 7.6 maximum (ELV range 6 to 9). All **visual inspections** were reported as "Clear" and "Odourless". This is indicative of a steady and stable treatment process. 264 samples of pH were carried out versus the agreed number of 261 (5 per week Vs "Daily"). Visual Inspection was recorded for Colour and Odour on all 264 occasions

There are no Emission Limit Values in the licence for **Total Oxidised Nitrogen** (as N), **Total Ammonia** (as N), or O**rthophosphate** (as P). The parameters were sampled and tested in accordance with the monitoring frequency in the Licence, i.e. fortnightly, 26 samples per annum.

Discharge Licence- Non Compliances

Total Nitrogen is Non-compliant in all counts, only 1 sample for the year being within the ELV limit and a further 2 within the 120%ELV limit. The Annual Mean was 20.56mg/l (19.33mg/l flow weighted) compared to a mean ELV of 10mg/l.

Total Phosphorus was non-compliant in 2015 for individual sample exceedences. 6 of the 28 samples taken for Total P exceeded the ELV and 4 tests exceeded the 120% ELV, whereas the allowed number to exceed the latter was 3. The flow weighted annual mean for Total Phosphorus was compliant with the mean ELV.

The condition for **Total Phosphorus** and Total Nitrogen to have 8 out of 10 samples to be less than or equal to the ELV was removed in a Technical Amendment to the licence issued in June 2014.

Storm Discharges, Treated Discharges & Combined Discharge

Stormwater and Treated Effluent are discharged via the same outfall from Carrigrennan WWTP. There were 46 instances of tested Stormwater parameter results exceeding an ELV in 2015, and 3 of these results exceeded ELV condition 2.

When Treated effluent and Storm Discharge flows and loads are combined and Combined Effluent quality compared, there are no discharges above the ELV limits in 2015 for these parameters beyond the allowable number, i.e. all within the allowed compliance limits.

2015	Storm Discharge to Outfall				Treated Discharge to Outfall during Storm Discharge				Combined Discharge to Outfall (same outfall)			
Date	Storm Overflow to Outfall	Storm COD	Storm SS	Storm cBOD	Treated Effluent Discharge to Outfall	Treated Outfall COD	Treated Outfall SS	Treated Outfall cBOD	Combined Storm & Treated Outfall Flow	Combined Storm & Treated COD	Combined Storm & Treated SS	Combined Storm & Treated cBOD

Interpretation of Sampling Results -Total N and Total P

The discharge point from Carrigrennan Waste Water Treatment Plant, i.e. The Lee Estuary/Lough Mahon, was designated a sensitive area in July 2004 under the Urban Waste Water Treatment (Amendment) Regulations, 2004.

Cork City (Carrigrennan) Waste Water Treatment Plant was not designed for Nutrient Removal Treatment when it was commissioned in 2004.

The ELV Exceedances as tabulated below for Total Nitrogen and Total Phosphorus. While demonstrating compliance with the Annual Mean ELV in the discharge licence for Total Phosphorus, the table reflects the fact that the plant is not designed for Nutrient removal. The table also illustrates that Total Nitrogen is not compliant with the UWWT regulations conditions including percentage reductions.

Sample Date	Mixed Crude Sewage	Final Effluent	Final Vs Crude	Mixed Crude Sewage	Final Effluent	Final Vs Crude
	Total Nitrogen (mg/L)	Total Nitrogen (mg/L)	% Reduction Total Nitrogen	Total Phosphorus (mg/L)	Total Phosphorus (mg/L)	% Reduction Total Phosphorus

UWWTD Compliance

The relevant parameters are tabulated below. This table outlines the ELV limits and % reductions achieved, for COD, cBOD, Suspended Solids and Total Nitrogen compared to UWWT regulation conditions. This results in no additional non-compliances.

Nutrient Parameter that applies (SI-48/2010) is TN

16 samples for **Total Nitrogen** of the 28 taken were within the Daily Average Emission Limit Value of 20mg/l. 1 sample was less than 10mg/l. While the maximum reduction achieved in a Total Nitrogen sample was 77%, the average reduction in Total Nitrogen, based on mean values, not flow weighted, was 23% for 2015, and related to the load this was reduced to5.3% i.e. non compliant in both cases.

Non-Compliances are reported quarterly, by agreement, to the EPA on the EDEN web based system, LMA, Licence Management Application.

All river monitoring was carried out in the same locations in 2015 as previous years
* Good -EPA 2011

Monitoring Overview

River Monitoring for D0033-01 CorkCity Agglomeration assesses the impact of the Wastewater Network on the river systems within the city.

The results of the River Ambient Monitoring are attached together with a Summary Table of Monitoring Results with associated graphs.

Monitoring is conditioned to be carried out at a frequency of 10 samples per year at locations designated M1 to M15 along the 5 water bodies under surveillance.
The Glasheen Stream (points M04 to M08) is a tributary of the Curraheen River (M01 to M03). The Glasheen Stream joins the Curraheen River downstream of point M03.
The Kiln River, (M15), is made up of the confluence of the both the Bride (M09, M11 & M12) and the Glen (M13 & M14) Rivers. These rivers join at Blackpool, downstream of M12 on the Bride and M14 on the Glen. M15, on the Kiln, is the only point monitored that theoretically incorporates both flows. This monitoring point however is adjacent to the mouth of a channel which carries a small portion of the combined flow and monitoring may not be representative of the main flow. M10 is on the Glenamought River, a tributary of the Bride, upstream of M11.
M01 on the Curraheen, M04 on the Glasheen, M09 on the Bride and M10 on the Glenamought are situated close to the boundary of the city. At these locations they represent rivers that have experienced an increasingly urban pressure as they approach the city proper. The first monitoring point on the Glen, M13, is a good distance into the city.

Compliance with Standards

The 5 river water bodies have not been individually monitored and assessed for status under the WFD. Under WFD, *Full Report for Waterbody*, the Curragheen has been stated as being monitored but it is not. All Waterbodies have been assigned overall ecological status by extrapolation. Both the Bride and the Glen are deemed *Moderate* and the Curragheen & Twopot, which is upstream of the Curraheen, are classified as *Poor*. The catchment of the Glasheen is also rated as *Poor*. No rating has been assigned to the Kiln. These status designations are based on Data produced prior to *Report to Europe 2010*. However in Monitoring carried out by the EPA in 2011, the donor waterbody for the Bride & Glen, IE_SW_755 Glashaboy Upper, has been attributed as *Good*.

These rivers do not have any other designation attached to them, Pearl Mussel, Bathing water etc.

Significance of Monitoring Results

There are no ELVs set in the Wastewater Licence for River Monitoring. Full details and discussion of significance of results are set out in the following paragraphs. Discharges from within the City have varying impacts on water quality

Monitoring Summary

Refer to **Summary Table of Monitoring Results 2015** and **Graphs** depicting trends for various parameters as highlighted, together with threshold conditions under S.I.272 of 2009. In order to better show trends, the colour codes for the WISE SOE classification, as per Water Framework Directive, are included in the Table where applicable.

Cork Harbour

Western Celtic Sea (HAs 18:19:20)

Harbour Monitoring Overview

Monitoring is conditioned to be carried out at a frequency of 10 samples per year at locations designated C5 to C9 within the Harbour. C5, *Haulbowline*, is located in the outermost point monitored, in the Coastal zone of Cork Harbour, C6, *End Lough Mahon* and C8, *Mid Lough Mahon* are in Transitional Waters, with C6 nearest the coastal zone. C8 is quite close to the location of the discharge outfall for the WWTP at Carrigrennan. C7, *Blackrock Castle* and C9, *Tivoli* are in the *Lower Lee Estuary*, Transitional Waters, with C9 being the most upstream monitoring point.

Monitoring was carried out on 10 dates between January & December 2015, at each location. For C5, C6, C7 & C8 a sample was taken at High and Low Tide, at Bottom, Middle and Top levels in the water. For C9 a sample was taken at High and Low Tide, at Bottom and Top levels in the water. In all, 60 samples were taken at C5, C6, C7,& C8 and 40 were taken at C9, rather than the 10 samples as indicated in the licence, albeit at 10 sampling occasions.

Trophic Status Assessment Scheme

The Status of individual estuarine and coastal water bodies is assessed using the EPA's Trophic Status assessment Scheme (TSAS). The scheme compares the compliance of individual parameters against a set of criteria indicative of trophic state. These criteria fall into three different categories which broadly capture the cause –effect relationship of the euthrophic process, namely Category A, Nutrient Enrichment (DIN & MRP), Category B, Accelerated plant growth (Chlorophyll & Macroalgae) and Category C, Disturbance to the level of dissolved oxygen normally present (DO % Saturation).

Eutrophic water bodies are those in which each of the criteria are breached, i.e. where elevated nutrient concentrations, accelerated growth of plants and undesirable water quality disturbance occur simultaneously;

Potentially Eutrophic water bodies are those in which two of the criteria are breached and the third falls within 15 per cent of the relevant threshold value;

Intermediate Status water bodies are those which do not fall into the Eutrophic or Potentially Eutrophic classes but in which breaches one or two of the criteria occur;

Unpolluted waterbodies are those which do not breach any of the criteria.

Assessment

The Status of each individual test location as monitored is assessed using the Trophic Status Assessment Scheme (TSAS) with the exception that tests were not carried out for Microalgae.

Thresholds are broadly in line with the limits set out in Table 8 (Biological Quality Elements) & Table 9 (Physico-Chemical conditions supporting the Biological elements) of S.I. 272 of 2009

S.I.272 of 2009

DIN is only assessed for Coastal Water bodies and not Transitional Water bodies. TSAS Thresholds are consistent with "Good" Status for Coastal waters in Table 9.

Molydate Reactive Phosphorous (MRP) is used to assess Transitional Water Bodies and not Coastal. TSAS Thresholds are consistent with Transitional water limits in Table 9

Chlorophyll limits for the Good to Moderate Boundary conditions in Table 8 are lower than those used as TSAS thresholds, i.e. 5 to 10 microg/l (Median) and 10 to 20 microg/l (90%ile) versus TSAS values of 10 to 15 median and 20 to 30 (95%ile).

DO % Sat, 95%iles, Upper and Lower limits. TSAS Thresholds are consistent with Transitional water limits in Table 9. In addition, TSAS Thresholds, dictated by salinity values, result in consistency with Coastal water limits in Table 9.

In addition

BOD (95%ile) value < or =4 mg/l applies to Transitional water bodies only in Table 9

Compliance with Standards

Trophic Status Assessment

Refer to Summary, 2015-2010 Trophic Status Tables of Results and in addition graphs of individual parameters for years 2010 to 2015. Note: While 2015 Threshold values are given in the graphs and are indicative of quality overall, they are relevant for 2015 only and reference should be made to tables only for pass/failure of particular years parameters.

Category A: Nutrient Enrichment

DIN: Dissolved Inorganic Nitrogen, (Ammonium plus Nitrate & Nitrite)

Winter DIN test results in 2015 exceeded the Thresholds at C9 Tivoli, and C7 Blackrock Castle, (C7 marginally), the locations nearest Cork City. This is a dis-improvement from recent years as demonstrated by Tables and Graph of Winter DIN- Median between 2010 and 2015 inclusive, whereby Winter DIN threshold was exceeded at C9 only in 2012 and all Winter DIN thresholds were exceeded each year in each location prior to that, 2011, 2010 etc.

Summer DIN results for 2015 were all in compliance with Thresholds.

MRP, Orthophosphate:

Both Summer and Winter MRP values for 2015 were in compliance with thresholds.

Category B: Accelerated Growth

Chlorophyll-a

All Chlorophyll-a concentration results (median and 90%ile) in 2015 for each of the 5 locations were in compliance with thresholds for TSAS and all, except the 90%ile for C7 Blackrock Castle, were also in compliance with Table 8 of SI 272 of 2009, Good-Moderate boundary conditions, ranking as Good.

Category C: Undesirable Disturbance

DO% Saturation

In 2015, 5%ile DO % Saturation results were below the lower threshold for compliance with standards, comparable to values in 2014. There was a trend in values, lowest being at C7 Blackrock Castle improving to best of 69.59% at C5, Cork Harbour.

The 2015 95%ile DO% Saturation results were in all in compliance. There was a trended increase in percentage saturation from Lough Mahon out to the Harbour but still within allowable limits by a good margin. This was an improvement over 2014 and 2013 when there were elevations above the limits.
In past years coastal blooms of *Phaeocystis Pouchetti or a.sanguinea* have explained DO % Sat. 95%ile values above the threshold limits.

BOD

All mean and 95%ile values were within the Good status requirements of SI 272 of 2009 for all 5 monitoring locations in 2013.

Trends

The trend for most parameters in general is for an improvement in water quality as one travels downstream from the smaller water body towards the larger water body and from the more dense settlement towards the more diffuse population.

Overall Trophic Status

The locations tested by Cork City Council, C9, C7, C8, C6 & C5, qualify as ***Intermediate*** *S*tatus in 2015, as was the case also for 2014 and back to 2011 inclusive.

The locations tested by Cork City Council, C7, C8, C6 & C5, qualified as ***Unpolluted*** *S*tatus in 2012. C9 at Tivoli, nearest the city qualified as ***Intermediate*** Status

The locations tested by Cork City Council, C5 to C9, qualify as ***Intermediate*** status in 2011 and 2009.

In 2010 however the values for C8, Mid Lough Mahon and C7, Blackrock Castle, Lower lee Estuary result in a ***Potentially Eutrophic*** status, due to the exceedances of the Category B, Chlorophyll parameters, unlike other years tested. C9 was on the balance point in 2010 between *Intermediate* and *Potentially Eutrophic,* when salinity is taken into consideration as explained previously. The Category B, Chlorophyll, parameters did not exceed the thresholds by more than 15%.

Comparison with EPA /WFD monitoring

EPA Monitoring Data: No data was available from the EPA for 2015 at time of writing, however 2014 data is analysed and attached.

EPA Sample data for 2014, indicate that the area around C9 Tivoli, (Lower Lee Estuary) is Eutrophic, failing in all three categories. Lough Mahon passes as *Intermediat*e status whereas on EPA data Cork Harbour and Outer Cork Harbour are deemed *Unpolluted*. This is at varience with the City Council data for that period with respect to status, which indicates the status for all four water bodies Lower Lee Estuary, Lough Mahon and Cork Harbour and outer Cork Harbour as *Intermediate.*

Drilling further into the information for Lower Lee Estuary, there is only one sampling location, LE160, which fails as Eutrophic, while the other three locations LE150, LE170 and LE180 all are deemed intermediate. LE160 is the only location which exhibits an excessively high value for the 90%ile of Chlorophyll-A although LE 170 has indications of stress.

Other Monitored Parameters

Acidification Status, pH

pH for all locations and seasons ranged between a maximum of 8.2 and a minimum of 7.6. This is well within the range between 6.0 and 9.0 cited in IS 272 of 2009 Table 9

Temperature

Temperature ranged from a maximum of 18.1 degrees C. in summer, to a minimum of 11.0 degrees C. in winter. Differences which are noted in temperatures, at the nearest points to Primary discharge at each sampling event, changes with sampling depth, and are not dissimilar to comparable changes at other sampling locations.

Total Ammonia

There is no standard requirement for Transitional or Coastal waters for Total Ammonia in SI 272 of 2009. For River water, the Good status, mean and 95%ile limits, is Less than or equal to 0.065 and 0.14 mg/l respectively. When ammonia is present in levels much above 0.1 mg/l N, sewage or industrial contamination may be indicated. All Summer & Winter 95%ile values were above this level, and also the SI 272 95%ile Limit.

TON, Total Oxidized Nitrogen (Nitrate + Nitrite)

Given that Nitrite concentrations are normally only 1-2 % of Nitrate, the value of TON generally reflects the concentration of nitrate in the water. High levels of nitrate in rivers can indicate significant run off from agricultural land but also can indicate the presence of sewage. Monitoring of tributaries contributing to the Lee within the City shows that Nitrate levels are quite high, i.e *Bad*, or close to *Bad* (in excess of 5.6 mg/l N,) at levels of 4.8 to7.9 mg/l N, as these rivers enter the city from the agricultural land surrounding it. Data from EPA monitoring of the River Lee itself at the waterworks, before it enters the city, LE040, (2012, latest data available) has a mean TON of 2.74 and 95%ile of 3.8 mg/l N. Both Median and 95%ile values for Summer TON, generally decrease gradually with distance from the city, i.e. from C9 to C5, reflecting increased dilution factors in moving from the smaller to the larger water bodies, from the Estuary, to Lough Mahon, to Cork

Harbour, the exception in 2015 being C7 Blackrock Castle which showed slight increases. This could be due to the influence of inflows from the Glashaboy Estuary opposite Blackrock Castle. Summer 95%ile concentrations at C9 Tivoli in 2015 are 2.3 mg/l whereas concentration is 0.1mg/l N at C5, Cork Harbour. Winter TON 95%ile values vary throughout, ranging from 3.288mg/l at C9, Tivoli, reducing to 0.41 mg/l at C5, Cork Harbour.

Total Nitrogen (organically bound Nitrogen incl Ammonia, plus Nitrate and Nitrite)

Concentration values are not dissimilar to TON with increases reflecting the addition of ammonia. The impact of nitrate concentrations would appear to make up the largest percentage of the Total Nitrogen impact on the waters. i.e. 2015 Worst case, winter 95%ile values at C7 Blackrock Castle, of 3.9mg/l for Total Nitrogen Vs 0.377mg/l for Ammonia and 2.3 mg/l for TON at same location.

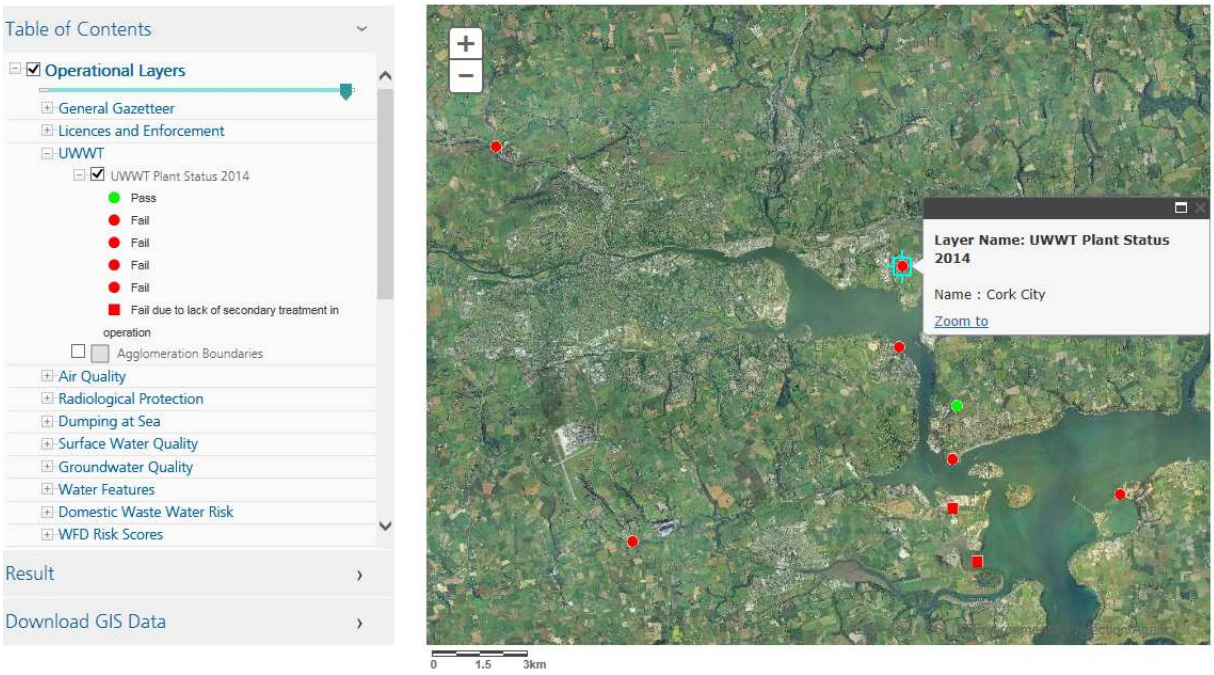
Conclusions

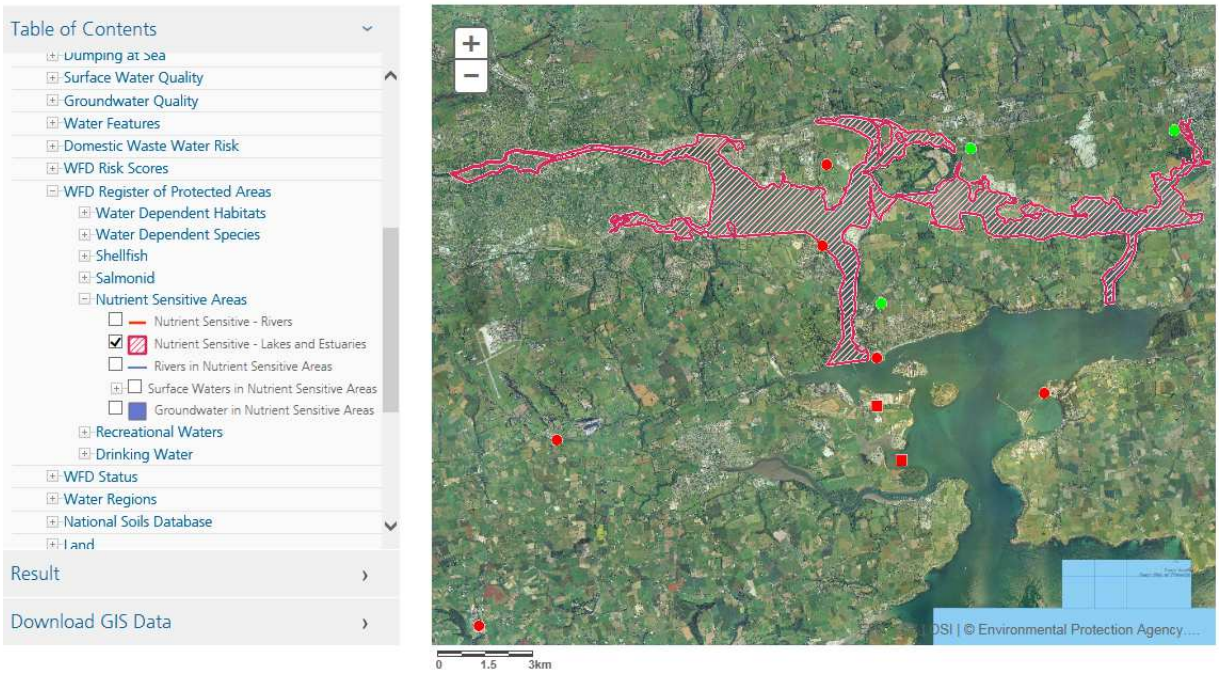
While conditions are not yet ideal, major improvement has been made to the Trophic Status of the Lee Estuary and Cork Harbour. This improvement should be attributed in the main to the construction of the Carrigrennan WWTP, as well as other treatment plant improvements in the area. Due to the complexity of the Harbour it is difficult to assign responsibility for parameter improvements or indeed exceedances to any particular input, being a product of the diffuse inputs into the water body. Nitrate levels in the rivers before entry to the city would appear to be a factor in the levels of Nitrate, DIN etc monitored in the Lower Lee Estuary and would also indicate similar Nitrate inflows from other river sources are also a possibility within the Harbour itself.

The Primary Discharge from Cork City is into Lough Mahon at Carrigrennan. This is the water body that has shown the greatest improvement in water quality over the past number of years since construction of the WWTP. The effects of secondary discharges are still evident in the poorer quality of water parameters in the Lower Lee Estuary. This area is closest to the City population and the bulk of the secondary discharges and is an area also influenced by inflows from the Glashaboy River. The Glashaboy estuary has been indicated as Potentially Eutrophic in the 2010-2012 EPA Trophic Status report and may be contributing to the raised levels being experienced in the adjacent Blackrock Castle, C7 monitoring location.

UWWT Plant Status 2014

Cork City fails in UWWT Plant Status due to a lack of Tertiary Treatment, as discharge from the WWTP at Carrigrennan is into designated Nutrient Sensitive Waters

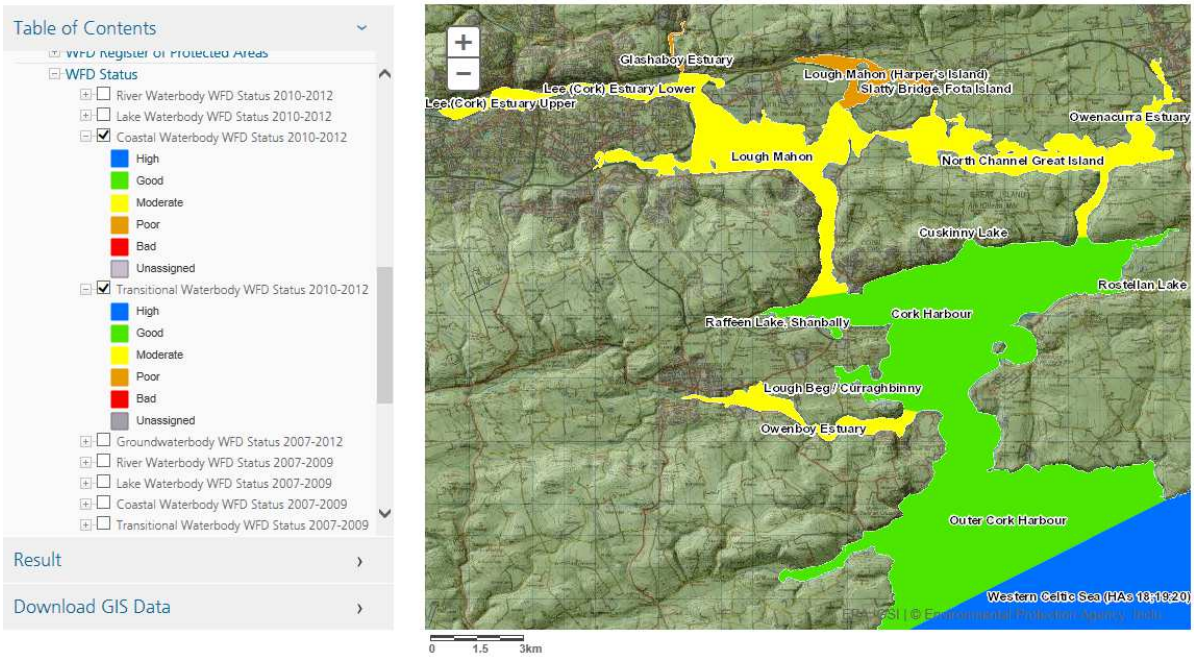




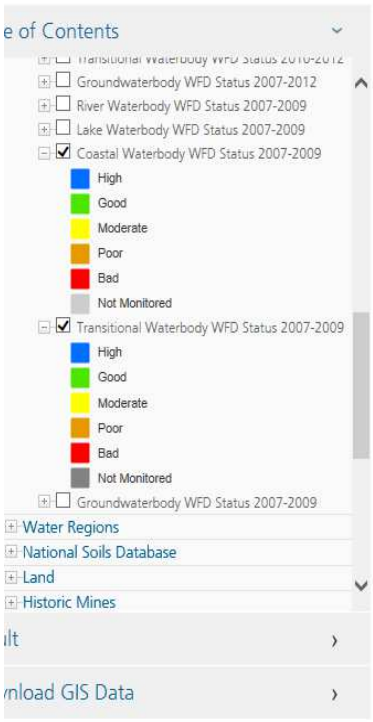
Ecological Status

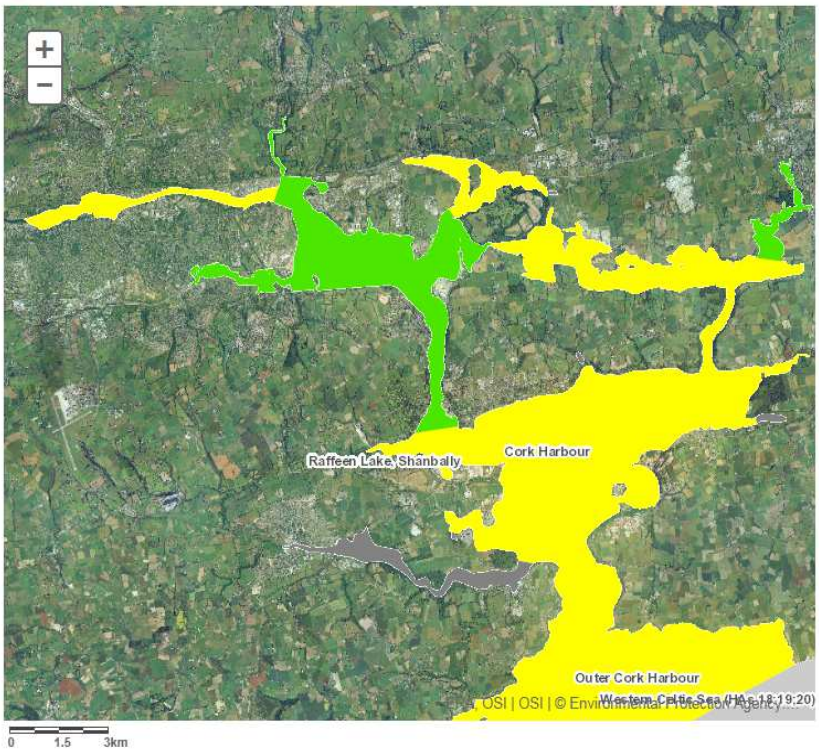
The most recent **Water Framework Directive** information, 2010 to 2012, available on the EPA Envision Website, designates the overall status of the Upper and Lower Lee Estuaries, Lough Mahon, North Channel Great Island and Owenacurra Estuary as Transitional Water Body – **Moderate**- Status. The Glashaboy Estuary and Harpers Island are designated as **Poor** Status. This is a dis-improvement from the previous 2007-2009 WFD Status where Lough Mahon and Glashaboy and Owenacurra Estuaries were both designated **Good** and all other Transitional waters designated **Moderate**. In contrast Cork Harbour and Outer Cork Harbour, Coastal waters, in 2010-2012 are designated as **Good** Status whereas previously in 2007-2009 they were designated **Moderate**. The overall objective is to restore waters to Good status by 2021. They are all designated at Risk Level 1a-At Risk. Ref *Water Matters SWRBD July 2010.*

2010-2012

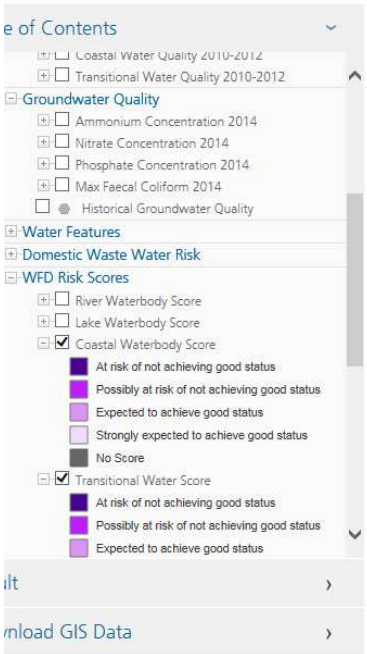


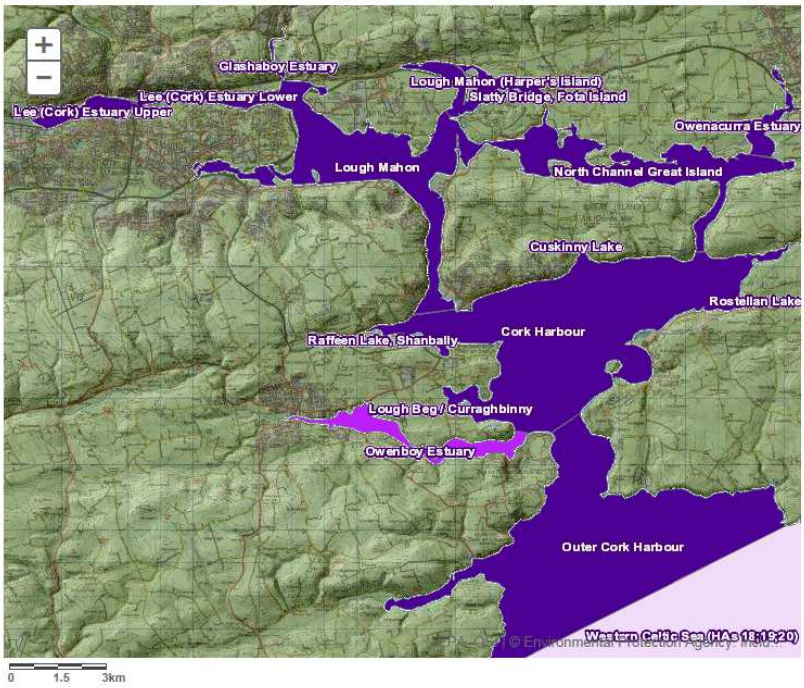
2007-2009





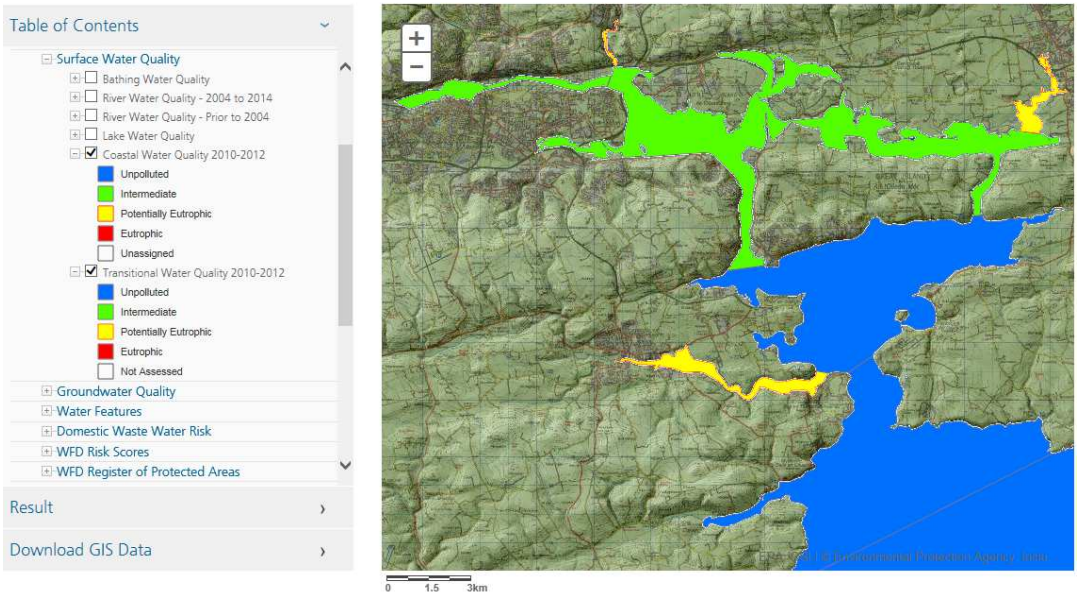
Risk Levels



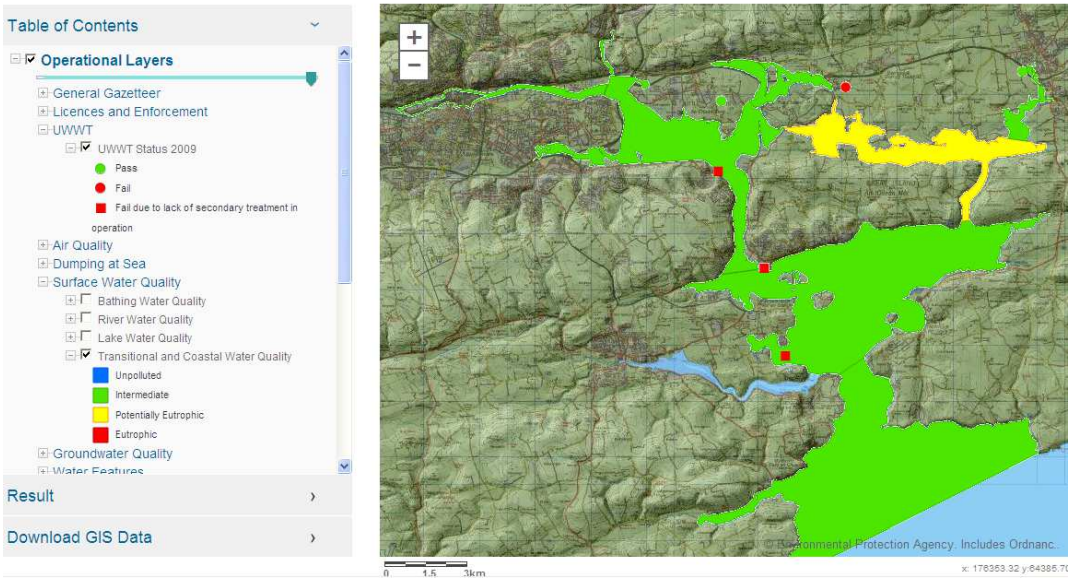


Trophic Status

The latest Update, for the period **2010-2012,** the **Surface Water Quality** information available on the EPA Envision website designated the Lower Lee Estuary and Lough Mahon as Transitional Water Body –**Intermediate**- Status, North Channel Great Island was designated also as Transitional Water Body –**Intermediate**- Status, and Cork Harbour, Coastal waterbody was designated as **-Unpolluted** –Status



For the period **2008-2010** the **Surface Water Quality** information available on the EPA Envision website designated the Lower Lee Estuary and Lough Mahon as Transitional Water Body –**Intermediate**- Status, North Channel Great Island was designated as Transitional Water Body –**Potentially Eutrophic**- Status, and Cork Harbour, Coastal waterbody as –**Intermediate -**Status.



An assessment of the Trophic Status of estuaries and bays in Ireland, was completed by the EPA in March 2001, before the WWTP was constructed at Carrigrennan for the Cork city agglomeration. In the Lee Estuary/Lough Mahon the criteria for DIN, MRP and Chlorophyll were exceeded and there was de-oxygenation which breached the lower limit (5%ile) for dissolved oxygen. With all three elements of the criteria breached the area was assessed as ***Eutrophic*** at that time.

Shellfish

The Shellfish Directive (2006/113/EC) is enacted in Ireland under S.I. 268 EC (Quality of Shellfish Waters) regulations 2006 and as amended by S.I. 55 0f 2009 and S.I 464 0f 2009. Shellfish Waters Mandatory and Guide values for parameters are listed in schedules 2 and 4 respectively of SI 268 of 2006.

There are 4 designated Shellfish areas in Cork Harbour. The nearest shellfish area to the WWTP discharge location is Cork Great Island North Channel. The shortest pathway to this from the Primary Discharge outfall, via the Belvelly Channel, a narrow tidal passage, measures a distance of 4.7 km to the Shellfish Great Island North Channel designated site. The alternative pathway to this Shellfish water is via Marloag Point and the main Ballynacorra River Channel, a distance of 16.8 km. There are also three designated shellfish areas in the adjacent tidal waters at Rostellan, namely Rostellan North, Rostellan South, and Rostellan West, These are 13.3 km, 13.27 km and 12.2 km, respectively, distant from the Cork City Primary discharge.

Shellfish Quality

Cork Harbour is currently Classified “B” for Oysters in the Shellfish classification based on E.Coli Monitoring,(<4,600 *E.coli* MPN $100g^{-1}$ shellfish flesh), i.e. Must be depurated, heat treated or relayed to meet class A requirements.

The Guide value under S.I.268 of 2006 for Faecal Coliforms is 300 MPN 100g-1 Shellfish flesh.

There is no mandatory value given for Faecal Coliforms.

Monitoring

The Sea Fisheries Protection Agency samples three sites within Cork Harbour as follows:
Cork Harbour North Channel East: Oysters (Area is closed and not in production)
Cork Harbour North Channel West: Oysters and mussels
Rostellan: Oysters. (Sampled on a quarterly basis as the site has not been in production for some time, and SFPA are now experiencing difficulties in finding live oysters for analysis.)
Results of Monitoring are shown in the attached graph.

Results of monitoring for 2015 would indicate that all areas and species tested complied with the Upper limit Class B but not Upper Limit Class A

Appendix 7.3 – Pollutant Release and Transfer Register (PRTR) Summary Sheets

Guidance to completing the PRTR workbook

PRTR Returns Workbook

Version 1.1.19

REFERENCE YEAR	2015

1. FACILITY IDENTIFICATION

Parent Company Name	Irish Water
Facility Name	Cork City Waste Water Treatment Plant
PRTR Identification Number	D0033
Licence Number	D0033-01

Classes of Activity

No.	**class_name**
-	Refer to PRTR class activities below

Address 1	
Address 2	
Address 3	
Address 4	
	Cork
Country	Ireland
Coordinates of Location	-8.33527 51.8878
River Basin District	IESW
NACE Code	3700
Main Economic Activity	Sewerage
AER Returns Contact Name	Niall Horgan
AER Returns Contact Email Address	nhorgan@water.ie
AER Returns Contact Position	Environment Compliance Specialist, Irish Water
AER Returns Contact Telephone Number	+353 1 8925396
AER Returns Contact Mobile Phone Number	
AER Returns Contact Fax Number	
Production Volume	0.0
Production Volume Units	
Number of Installations	0
Number of Operating Hours in Year	0
Number of Employees	21
User Feedback/Comments	50% Reduction in Storm overflows (fugitive) in 2015 over 2014 leading to +/-50% excess warnings. Wet Cake and Dried Pellet quantities shown seperately on Waste return. Normal Process for 2015. Not all Priority Substances which were tested in 2014 were tested again in 2015. Query regarding some results from Laboratory whether Effluent interchanged with Influent results, which may give over-high results for PAHs.Accuracy of LOD for NonylPhenol results precluded their use.
Web Address	

2. PRTR CLASS ACTIVITIES

Activity Number	**Activity Name**
5(f)	Urban waste-water treatment plants

3. SOLVENTS REGULATIONS (S.I. No. 543 of 2002)

Is it applicable?	
Have you been granted an exemption ?	
If applicable which activity class applies (as per Schedule 2 of the regulations) ?	
Is the reduction scheme compliance route being used ?	

4. WASTE IMPORTED/ACCEPTED ONTO SITE

Guidance on waste imported/accepted onto site

Do you import/accept waste onto your site for on-site treatment (either recovery or disposal activities) ?	

This question is only applicable if you are an IPPC or Quarry site

					0.0	0.0	0.0	0.0

* Select a row by double-clicking on the Pollutant Name (Column B) then click the delete button

Additional Data Requested from Landfill operators

For the purposes of the National Inventory on Greenhouse Gases, landfill operators are requested to provide summary data on landfill gas (Methane) flared or utilised on their facilities to accompany the figures for total methane generated. Operators should only report their Net methane (CH4) emission to the environment under T(total) KG/yr for Section A: Sector specific PRTR pollutants above. Please complete the table below:

Landfill: Cork City Waste Water Treatment Plant

Please enter summary data on the quantities of methane flared and / or utilised	**T (Total) kg/Year**	**M/C/E**	**Method Used**		**Facility Total Capacity m3 per hour**	
			Method Code	**Designation or Description**		
Total estimated methane generation (as per site model)	0.0				N/A	
Methane flared	0.0				0.0	(Total Flaring Capacity)
Methane utilised in engine/s	0.0				0.0	(Total Utilising Capacity)
Net methane emission (as reported in Section A above)	0.0				N/A	

4.2 RELEASES TO WATERS Link to previous years emissions data | PRTR# : D0033 | Facility Name : Cork City Waste Water Treatment Plant | Filename : D0033_2015_PRTR.xls | Return Year : 2015 | 12/02/2016 17:40

SECTION A : SECTOR SPECIFIC PRTR POLLUTANTS

Data on ambient monitoring of storm/surface water or groundwater, conducted as part of your licence requirements, should NOT be submitted under AER / PRTR Reporting as this

	OUTPUT - automatically generated cell value

RELEASES TO AIR

Air: Emissions from WWTP Works

Data Entry Table: Characteristics of the WWTP

For use where no data from on-site monitoring of air emissions from the plant are available.
Nitrous Oxide (N2O) calculated directly for actual p.e. data

1 Loadings and Works		
A Facility Loadings Data for Reporting Year	**Value**	
Total p.e. served	250,011	*Enter Actual Population Equivalent of catchment*
Design p.e.	413,200	*Enter Design Population Equivalent of facility*
Total influent BOD kg/annum (measured)	5,475,238	*Enter total annual quantity;* ***NB note units: kg/annum***
Total Sludge removed offsite kg Dry Matter / annum		*Enter total annual quantity;* ***NB note units: kg/annum***
Total Sludge digested on-site kg Dry Matter / annum	2,670,600	*Enter total annual quantity;* ***NB note units: kg/annum***

For information only:
Calculated Values (see Calculations Worksheet)

TOW kg BOD / annum	
TOW = "Total Organically biodegradable material in domestic (=municipal) Wastewater"	
5,478,991	Total p.e. served TOW equivalent
9,055,278	Design p.e. TOW equivalent
249,840	**Quality check: p.e. of influent BOD kg/annum**
0	*BOD content of sludge removed kg/annum*
1,068,240	*BOD content of sludge digested kg/annum*
4,406,998	Residual BOD net of sludge removed/digested kg/annum

B Characteristics of the Works		Status	
B1 Aerobic plant			
Does the aerobic section of the plant contain dissolved oxygen?			*Y / N (default is "Y")* **Methane Conversion factor for the aerobic plant will be determined by this answer**
All tanks covered and extracted to on-site flare?			*Y / N (default is "N")* **Releases will be reported as "Fugitive"**
% of Headspace biogas utilised on site (0 - 100)			*Only required if Headspace extraction on site; Calculate by % operation of engine. Default assumption is Zero utilisation*
% of Headspace biogas flared (0 - 100)			*Only required if Headspace extraction on site; Calculate by % operation of flare. Default assumption is Zero flaring*
Total % biogas utilised or flared onsite			

B2 Onsite Anaerobic Digestion for sludge treatment	Status	
Anaerobic digestion on site?	Y	*Y / N (default is "N")* **Releases will be reported as "Emission Point 1"**
% of Digester biogas utilised on site (0 - 100)	95	*Only required if Anaerobic digestion on site; Calculate by % operation of engine. Default assumption is Zero utilisation*
% of Digester biogas flared (0 - 100)	5	*Only required if Anaerobic digestion on site; Calculate by % operation of flare. Default assumption is Zero flaring*
Total % biogas utilised or flared onsite		

2 Estimated Fuel use at the UWWTP	Diesel Usage Tonnes/annum	
Total Diesel Use on site in the year	6.6	***Tonne / annum*** **Releases will be reported as "Fugitive"**

The output data is presented on this worksheet in the precise format for transfer directly into the "**Releases to Air**" Worksheet of your AER/PRTR Emissions Reporting Workbook

		ESTIMATED QUANTITIES			
PRTR No. Annex II	Name	**Emission Point 1**	**T (Total) KG/Year**	**A (Accidental) KG/Year**	**F (Fugitive) KG/Year**
1	Methane (CH4)	0	0	0	0
2	Carbon Monoxide (CO)	1,794	1,865	0	71
3	Carbon Dioxide (CO2)	528,779	6,059,639	0	5,530,860
5	Nitrous oxide (N2O)		27	0	27
7	Non-methane volatile organic compounds (NMVOC)		22	0	22
8	Nitrogen oxides (NOx/NO2)	5,487	5,704	0	216
11	Sulphur oxides (SOx/SO2)		21	0	21

Wastewater Treatment Data Input

NEXT

CELL COLOUR KEY:

- **INPUT** - Select value from drop down list
- **INPUT** - type in your facility value in cell
- **OUTPUT** - automaticaly generated cell value

Facility Name	Cork City Waste Water Treatment Plant
Address	Carrigrennan, Little Island, Co. Cork
Reporting Year	
Licence Reg. No.	D0033-01

Enter Facility Details

P.E. (Actual Treated)	>50000 p.e.
Saline Intrusion	Yes saline intrusion
Type of Treatment	Secondary Treatment - Activated Sludge
Nutrient Removal	No Nutrient Removal

These parameters are required to generate estimated PRTR mass emission values.
Click on the cell and select from the drop down menu.
Refer to the Definitions below for further information.

Please enter Total Annual Flow (m³/annum):

Treated (Predominant/Main Emission):	40748090 m3/annum
Fugitive Emissions:	1503880 m3/annum
TOTAL:	42251970 m3/annum

Final effluent volume released via the main emission point
Additional estimated volume released in storm bypasses

Definition of Input Requirements

P.E. (Actual Treated): P.E. (population equivalent) is a measurement of the average organic biodegradable load received daily at the treatment plant. A population equivalent of 1 (1 p.e.) means the organic biodegradable load having a five-day biochemical oxygen demand (BOD5) of 60g of oxygen per day. Select a P.E. band (**<10,000 p.e., 10,000 - 50,000 p.e., >50,000 p.e.**) into which the actual operating P.E. of the treatment plant falls. (Please note: the operating P.E. is based on the existing population served and not the design population size of the UWWTP).

Saline Intrusion: Identify whether saline intrusion is known to occur within the sewage network serving the treatment plant. This will be the case for some coastally located UWWTPs.

Type of Treatment: Identify the type of treatment provided at the plant. Treatment options are "No Treatment", "Primary Treatment Only", "Secondary Treatment - Activated Sludge", "Secondary Treatment - Attached Growth", "Tertiary Treatment - Filtration", and "Tertiary Treatment - Disinfection".

Nutrient Removal: Identify whether nutrient removal is employed at the treatment plant. Nutrient removal options are "Phosphorus Removal Only - Biological/Chemical/Wetland", "Nitrogen Removal Only", "Phosphorous and Nitrogen Removal", and "No Nutrient Removal".

Measured Values

CELL COLOUR
INPUT - type in your facility value in cell
OUTPUT - automaticaly generated cell value

Enter all measured values in this sheet

Note: If you do not have measured values then LEAVE THE CELL BLANK

Measured values reported in this worksheet should be the average concentration of the pollutant measured over the previous reporting year. Measured values should be used when they are available rather than estimated values from the Toolset. Measured values relate to parameters that are analysed in a laboratory. Please enter the measured values to the orange cells in mg/l for the year.

Note: the unit of measurement must be in mg/l for all parameters entered on this sheet.

Where measured values are reported, the Method Code must be indicated in the "Method of Measurement" column. The method code used shall be in accordance with the internationally approved measurement methods - please refer to the UWW PRTR Electronic Toolset Guidance Document on the EPA website. The method description should also be provided as indicated below.

Note: Wastewater licensed pollutants such as BOD and COD, Ortho- P are included at the bottom of this sheet - please enter annual measured data in mg/l for these.

Method Codes

ISO/CEN Standard - If the laboratory is working to an ISO/CEN standard that is on the approved list of standards, you should use this as the method code. Example for Total Nitrogen is EN ISO 11905-1:1998. Leave the Description Field Blank in the PRTR Workbook.	**Example for Total Nitrogen**	**EN ISO 11905-1:1998**	**Method Description: Blank**
OTH - If the method you are using is not an ISO/CEN standard or does not fall under any of the other method codes then use OTH. This method code would apply when using methods from the Standard Methods for the Analysis of Water and Wastewater series or when using a Hach Spectrophotometric Method for Total Nitrogen, for example. Use the method code OTH and please put a description of the method in the method description field in the PRTR Emissions Reporting Workbook.	**Example for Total Phosphorus**	**OTH**	**Method Description: Standard Methods for the Analysis of Water and Wastewater - Total P Analysis**

UWWT Facility Details:	>50000 p.e., Yes saline intrusion, Secondary Treatment - Activated Sludge, No Nutrient Removal

Enter your measured values in these two columns

Double-click the cells below to select the method code

Enter your method description in this column

Releases to Water Output Table

CELL COLOUR KEY:
INPUT - Type in your facility value in cell
OUTPUT - automatically generated cell value

Export Data to PRTR Workbook

Click the Red Arrow to transfer all the measured and estimated data to the PRTR Emissions Reporting Workbook for this specfic UWWTP. Please ensure the PRTR Workbook is closed prior to the transfer and select the correct PRTR Workbook from your dedicated folder for this UWWTP.

Please ensure that all the Inputs for Air and Water are completed prior to transfer. Please update the PRTR Workbook with method descriptions and waste transfers prior to upload.

Facility Name:	Cork City Waste Water Treatment Plant
Address:	Carrigrennan, Little Island, Co. Cork
Reporting year:	0

Treated: Final effluent volume released via main emission point	40,748,090
Fugitive: Estimated additional volume released in storm bypasses	1,503,880
Total Annual Flow (m³/annum):	*42251970*

SECTION A : WWTP SPECIFIC PRTR POLLUTANTS

Note '#VALUE!' error messages will disappear when flow data are entered above

Appendix 7.4 – Sewer Integrity Tool Output

	Section 1.1 Agglomeration Details					
	Name	**Insert Agglomeration Name**				
	Licence Number	**Insert Licence Number and Revisions Number (eg D0045-02)**				
	Insert Name of Catchment if the Risk Assessment is for part of an agglomeration (only divide agglomeration where p.e. >5,000p.e. and where such division is warranted)	**Insert Catchment Name (e.g., Downtown Pumping Station network). Refer to Guidance Notes for rules on division of large agglomerations.**				
	Date Licence Issued	**Insert Date**				
	Current Date	**Insert Current Date**				
			Year	Year	Year	Year
	Waste Water Works - Wastewater Treatment Plant Details	**Unit**	2015	2016	2017	2018
1.1	Is there an existing WWTP in operation?		**Yes**	**Yes**	**Yes**	**Yes**
	Section 1.2 BOD Loading & Population Equivalent					
1.2	Average Daily Influent Flow or Average Total Flow in system (If no measured data exists, insert estimated figure)	l/day, measured	109053000			
1.3	Average Daily Influent BOD or Average BOD Load from area served (If no measured data exists, insert estimated figure)	mg/l, measured	137.6			
1.4	Total BOD Load	kg/day	15005.6928	0	0	0
1.5	Average Population Equivalent (@0.06kg/person/day)	p.e.	250095	0	0	0
1.6	Estimated (existing) Non-Domestic Load	p.e.	132175			
1.7	Estimated Domestic Load	p.e.	117920	0	0	0
1.8	Occupancy Rate for the Agglomeration	pop/house	2.61			
1.9	Estimated Number of Connected Properties	houses	45180	0	0	0
1.10	Number of properties within the agglomeration when compared with CSO Data or An Post Geodirectory	houses	75263			
	Section 1.3 Hydraulic Details					
1.11	Average Dry Weather Flow arriving at WWTP OR Total Average DWF in system (If no measured data exists insert estimated figure)	l/s, measured	895			
1.12	Estimated 3DWF	l/sec	2685.00	0.00	0.00	0.00
1.13	Annual Average Peak Flow to WWTP or discharging from whole system if there is no existing WWTP	l/s, measured	2766			
1.14	This Annual Average Peak as Multiples of Dry Weather Flow (Peaking Factor)	Nr	3.09	0.00	0.00	0.00
1.15	Highest Peak Flow Recorded (Insert UNKNOWN if no records exist)	l/s	2911			
1.16	Does this Peak Flow (multiple of DWF) cause hydraulic capacity problems within the network ?	---	No	Yes	Yes	Yes
1.17	Total Rainfall for Previous Year	mm	1447			
1.18	Comparison - Mean Annual Rainfall for the agglomeration	mm	1228			
1.18.1	Define the Weather Station Used		Cork Airport			
1.19	If Storm Water Storage is available at the Wastewater Treatment plant, what is the volume of the storm tank ?	m^3	15400			
1.20	Is the capacity of the storm tank sufficient to capture and retain all overflows to the tank ?	---	No	No	No	No
1.21	Total monthly average volume of Storm Water Stored or Returned for Treatment within the Waste Water Treatment Plant	m^3 per month	63814			
1.22	If the answer to 1.20 above is No, What is the estimated frequency of Overflows from the Storm Tank ? (N/A if no overflow)		> 5 times per month	< 1 per month	1 to 2 times per month	< 1 per month
	Waste Water Works - Sewer Network Details	**Unit**	2015	2016	2017	2018
	Section 1.4 Waste Water Works - Gravity Sewer Details					
1.23	What database is used to maintain records of the sewer network		Other Record	SUS 2001	SUS 2002	SUS 2003
1.23.1	If other or combination of the above please describe	Describe	ArcGis			
1.24	Total length of sewers (use drop down menus to define whether these figures are estimated or measured)	km Estimated	403.38	0.00	0.00	0.00
1.24.1	Total length of sewers > 450mm Diameter	km Estimated	60.28			
1.24.2	Total length of sewers > 300mm but ≤ 450mm in Diameter	km Estimated	35.27			
1.24.3	Total length of sewers > 225mm but ≤ 300mm in Diameter	km Measured	59.99			
1.24.4	Total length of sewers ≤ 225mm in Diameter	km Estimated	247.84			
1.24.5	Other	km Estimated	Unknown			
1.25	Pipeline Material					
1.25.1	What portion of the sewer network consists of Concrete Pipes	% Estimated	33%			
1.25.2	What portion of the sewer network consists of Plastic Pipes	% Estimated	33%			
1.25.3	What portion of the sewer network consists of Clay materials	% Estimated	24%			
1.25.4	What portion of the sewer network consists of Brick Type Sewers	% Estimated	5%			
1.25.5	What portion of the sewer network consists of Other Materials	% Estimated	5%			
1.26	Total number of Storm Water Overflows	Nr	71			

1.27	What Screening or other mechanical devices are employed at the storm water overflows					
	SWO No. _ located at _____	Describe				
1.28	Water Quality at the receiving waters					
1.28.1	Where the receiving water is a river - indicate the EPA Biological Rating of the Receiving Water for each SWO below (Particularly if there is more than one receiving water within the agglomeration)					
	SWO No. __ located at ___	Describe	Q5			
1.28.2	Where the receiving water is a coastal water indicate the Status of the Receiving Water for each SWO below (Particularly if there is more than one receiving water within the agglomeration)					
	SWO No. _ located at _____	Describe	Moderate			
1.28.3	With reference to the SWO's detailed above define if the receiving waters are sensitive in accordance with the Urban Wastewater Treatment Regulations as amended.					
	SWO No. _ located at _____	Describe	Sensitive			
1.28.4	With reference to the SWO's detailed above define are the receiving waters Protected Areas (designated or awaiting designation)					
	SWO No. _ located at _____	Designation				
1.28.5	With reference to the SWO's detailed above define do the receiving waters have any other designations.					
	SWO No. _ located at _____	Designation				
	Section 1.5 Waste Water Works - Pumping Stations					
1.29	Number of Pumping Stations (operated by the Local Authority)	Nr	38			
1.30	Total Length of Rising Mains (operated by the Local Authority)	km	18.7			
1.31	Rising Main Material					
1.31.1	What portion of the rising mains consists of ductile iron pipes	% Measured	33%			
1.31.2	What portion of the rising mains consists of plastic pipes	% Measured	66%			
1.31.3	What portion of the rising mains consists of other materials	% Estimated	N/A			
1.32	Discharge Capacity of the Pump Set (s) at normal duty point					
	At Pump Station __ at _____					
1.33	What percentage of the pumping stations have recorded flow data (i.e. if all pumping stations have flow meters on the rising mains then this would read 100%)	%	10.00%			
1.34	Available Storage Capacity at Pump Stations (include pump sump and any storm water/emergency overflow tanks)					
	At Pump Station __ at _____	m^3	10			
1.35	Total Number of ***"Licenced Secondary Discharge Points and Stormwater Overflows"*** at pumping stations	Nr	4			
1.36	Total Number of ***"Emergency Overflow Points"*** at pumping stations	Nr	34			
1.37	What Screening or other mechanical devices are employed at the secondary discharge points or emergency overflows ?					

	At Pump Station __ at _____	Describe	6mm Screen			
1.38	Water Quality at the receiving waters at each pumping station location					
1.38.1	Where the receiving water is a river - indicate the EPA Biological Rating of the Receiving Water for each secondary discharge point or emergency overflow at each pumping station (Particularly if there is more than one receiving water within the agglomeration)					
	At Pump Station __ at _____	Describe	Q5			
1.38.2	Where the receiving water is a coastal water indicate the Status of the Receiving Water for each secondary discharge point or emergency overflow at each pumping station (Particularly if there is more than one receiving water within the agglomeration)					
	At Pump Station __ at _____	Describe	Moderate			
1.38.3	With reference to the pumping stations, for each secondary discharge point or emergency overflow detailed above, define if the receiving waters are sensitive in accordance with the Urban Wastewater Treatment Regulations as amended.					
	At Pump Station __ at _____		Sensitive			
1.38.4	With reference to the pumping stations, for each secondary discharge point or emergency overflow detailed above, are the receiving waters Protected Areas (designated or awaiting designation) .					
	At Pump Station __ at _____	Designation				
1.38.5	With reference to the pumping stations, for each secondary discharge point or emergency overflow detailed above, do the receiving waters have any other designations.					
	At Pump Station __ at _____	Designation				
1.39	Estimated Number of Private Pumping Stations within the agglomeration (not operated by the Local Authority)	Nr	5			
	Section 1.6 Reporting					
	Section 1.6.1 Reported Number of Sewer Related Complaints ('Complaint' as defined in the Discharge Licence)					
1.40	Number of Reported Complaints	Nr	2			
1.41	Number of Reported Complaints which have been rectified	Nr	2			
	Section 1.6.2 Reported/Recorded/Estimated Number of Secondary Discharges					
1.42	Number of Reported Secondary Discharges	Nr	1			
1.43	Number of Recorded Secondary Discharges	Nr	1			
1.44	Estimated Total Number of Secondary Discharges	Nr	2	0	0	0
	Section 1.6.3 Reported/Recorded/Estimated Number of Emergency Overflow Discharges from Pumping Stations					
1.45	Number of Reported Emergency Overflow Discharges	Nr	1			
1.46	Number of Recorded Emergency Overflow Discharges	Nr	1			
1.47	Estimated Total Number of Emergency Overflow Discharges	Nr	2	0	0	0
	Section 1.7 Operational Staff					
1.48	In the four boxes below, describe the extent of operation staff employed by the Local Authority to maintain and operate the sewer network and pumping stations *(The individual personnel shall not be named , only grade and level of training needs to be provided)*					

1.48.1	For example, 1 Nr. Fulltime Caretaker employed at General Operative Level (with basis H&S training) to operate & maintain the sewer network. 1 Nr. Part-time Caretaker employed as a Mechanical Fitter (FETAC Level 5) to operate & maintain the pumping stations.	reman with 14 GO to operate Network within City Borough Boundary,				
1.48.2		1 Fitter,1 Electrician & GO for Pump Stations in City				
1.48.3		Technichian & Contractors for Pump Stations, City				
1.48.4		Contractor, 24 hour, on Chief PS & Header Chamber				
	Waste Water Works - Investment Details	**Unit**	2015	2016	2017	2018
	Section 1.8 Capital Investment works carried out since most recent report (including works not included on WSIP Programme or not WSIP funded)					
1.49	Sewers Upgraded or Replaced	m	200			
1.50	Sewers Rehabilitated	m	0			
1.51	Manholes Rehabilitated	Nr	5			
1.52	Local Repairs	Nr	50			
1.53	Total Length of sewers Upgraded, Replaced or Rehabilitated	m	200	0	0	0
1.54	Pumping Stations Operated by Local Authority Upgraded or Repaired	Nr	38			
1.55	WWTW operated by Local Authority Upgraded or Replaced	Nr	0			
1.56	In the following two cells describe the actual Capital Investment undertaken in the reporting period.					
1.56.1	For example : Sewer Rehabilitation Contract Works being undertaken under the WSIP					
1.56.2						
	Section 1.9 Licence Specified Improvements Works					
1.57	*The Local Authority is required to report on the extent of Improvement Works which have been specifed under the Licence as issued by the EPA. Reference which AER contains this information*		2012 AER			
	Section 1.10 Other Updates Since Last Report					
1.58	*For example : 50% of the sewer network is currently being upgraded under the WSIP with an investment of €1.5m in 2010.*					
1.59	*For example : 2% of the sewer network is currently being replaced under the Local Authorities Annual Maintenance Fund*

Section 2.1 Hydraulic Risk Assessment

Query	Description	Prompt	Risk Score	Short Commentary by the Local Authority	Comment or Action to be Taken
2.1	**Has a Hydraulic Performance Assessment been undertaken for the Sewer Network (e.g., Computer Model or other Engineering Design or Design Review) ?**	No	40		If the answer is **No** assess the need and cost benefit of developing a computer model or engineering design assessment of the Sewer Network and complete Query 2.12. If the answer is **Yes** proceed to Queries 2.1.1 to 2.1.4 inclusive
2.1.1	If Answer to Query 2.1 is Yes, what % of the Network is covered by the hydraulic assessment ?	N/A	0		The % coverage of the Network by the Hydraulic Assessment can be estimated by the area assessed against the area served by the Network. ENTER "N/A" IF COMPUTER MODEL or DESIGN DOES NOT EXIST. DO NOT LEAVE BLANK OR ENTER "0".
2.1.2	How many years has it been since the **completion** of the hydraulic assessment ?	more than 10	0		Select N/A response if no design assessment or design exists.
2.1.3	Are the outcomes of the Hydraulic Assessment being implemented ?	No	0		Select N/A response if no design assessment or design exists.
2.1.4	How many years has it been since the **outcomes** of the hydraulic assessment have been implemented ?	more than 10	0		Select N/A response if no hydraulic performance assessment or design exists. For onging works select "less than 5".
2.2	**Has a Dynamic Computer Model been used to Assess the Hydraulic Performance of the Sewer Network ?**	No	10		Computer Model means a Hydroworks/Infoworks Model, Micro-Drainage Model or equivalent.
2.3	**Has a Manhole Survey been undertaken in accordance with WRc Documentation "Model Contract Document for Manhole Location Surveys and the Production of Record Maps" ?**	No	10		If the answer is **No** assess the need and cost benefit of undertaking a Manhole Survey and complete Query 2.12. If the answer is **Yes** proceed to Query 2.2.1
2.3.1	If yes, how many years has it been since the survey was undertaken or updated?	N/A	0		Select N/A if no Manhole Survey has been undertaken. Enter N/A value for Confidence Grade if Prompt Box is "N/A"
2.4	**Has a Flow Survey been undertaken in accordance with WRc Documentation "A Guide to Short Term Flow Surveys of Sewer Systems" and "Contract Documents for Short Term Sewer Flows" ?**	No	20		If the answer is **No** assess the need and cost benefit of undertaking a Flow Monitoring Survey and complete Query 2.12. . If answer is **Yes** Proceed to Query 2.5
2.5	**What was this Flow Survey Information Used for ?**				
2.5.1	To Determine the extent of Problematic Sewer Catchments	No	0		Select N/A if no Flow Survey has been undertaken.
2.5.2	To Verify a Computer or Mathematical Model of the Network	No	0		Select N/A if no Flow Survey has been undertaken.
2.6	**Have Performance Criteria been developed to determine the short, medium or long term capacity of the sewer network ?**	No	10		If the answer is **No** assess the Future Needs of the Sewer Network and complete Query 2.12. If the answer is **Yes** proceed to Query 2.8
2.7	**How many flood events resulting from surcharge in the network have occurred in the past 3 years?**	more than 6	10		Flood events in this context means water/sewage backing up from the Network causing flooding of properties or causing disruption of traffic
2.8	**Are there deficiencies in performance criteria within the sewer network ?**	Yes	20		If the answer is **No**, Proceed to Query 2.10 and complete Query 2.12. If the answer is **Yes** proceed to Query 2.9
2.9	**Have the causes of these deficiencies in the Performance Criteria been identified and rectified ?**	N/A	0		If the answer is **No**, consider further examination of the hydraulic model (if available) and complete Query 2.12. If the answer is **Yes** proceed to Query 2.10
2.10	**Can the Hydraulic Assessment (defined in Query 2.1 above) be used to determine the benefit of reducing the contributory Impermeable Areas or extent of surface water contributions**	No	10		If the answer is **No**, consider further development of the Hydraulic Assessment (or model if available) and complete Query 2.12. If the answer is **Yes** proceed to Query 2.11
2.11	**Has an Impermeable Area Survey been carried out for the agglomeration or parts of the agglomeration ?**	No	10		If the answer is **No**, consider the need and cost benefit of undertaking an Impermeable Survey for parts of the agglomeration which are under hydraulic pressure and complete Query 2.12. .
	Total Risk Assessment Score (RAS)		**140**		
2.12	**Prepare Assessment of Needs & Sewer Upgrade Implementation Plan**	In the AER Attach Assessment of Needs and Rehabilitation Implementation Plan as separate documents			
2.13	In the AER provide Summary of Proposed Works or Direction to be taken to improve hydraulic efficiency				

Section 3.1 Environmental Risk Assessment					
Query	**Description**	**Prompt**	**Risk Score**	**Short Commentary by the Local Authority**	**Comment or Action to be Taken**
3.1	What Environmental or Discharge Quality Data is available with regard to the sewer network ?	up-to-date electronic or paper database exists	0		Select N/A if no discharges, secondary discharges or overflows from network; if discharges do exist complete Query 3.12
3.1.1	Do trade effluents discharge to the sewer network?	Yes	20		If the answer is **No**, proceed to Query 3.1.2. If the answer is **Yes**, Proceed to Query 3.2
3.1.2	Are there Storm Water Overflows within the network ?	Yes	20		If the answer is **No**, proceed to Query 3.1.3. If the answer is **Yes,** Proceed to Query 3.3
3.1.3	Are there Secondary Discharges within the network (excluding Emergency Overflows at Pump Stations)?	Yes	20		If the answer is **No**, proceed to Query 3.1.4.
3.1.4	Is there any evidence that exfiltration is occurring from the network ?	Unknown	20		If the answer is **No**, does all wastewater enter a wastewater treatment plant (insert summary details in the AER)? If **Yes**, Proceed to Query 3.6
3.2	If Answer to Query 3.1.1 is "Yes", what % of trade effluents have a licence to Discharge to the Public Sewer ?	21 - 30%	28		Select N/A if answer to Query 3.1.1 is **No**. If not all trade effleunts are licenced, Local Authority should consider issuing and controlling such discharges under the appropriate Legislation.
3.2.1	Are all licenced trade Discharges compliant with their relevant licence and associated conditions	No	10		Answer N/A if none of the trade effluents are licenced. Answer No if this information is unknown. If the answer is **Unknown** or **No**, consider issuing a direction to the relevant Licencee. If the answer is **Yes,** no further action is needed.
3.2.2	If Answer to Query 3.2.1 is "No", state what % of Trade Discharges are NOT compliant with their relevant licence and associated conditions (where that non-compliance led to enforcement action)	11 - 25%	10		Select **N/A** if answer to Query 3.2.1 is Yes. If N/A is selected as answer to Query 3.2.2
3.3	In accordance with the DoEHLG paper "Procedures & Criteria in relation to Storm Water Overflows", what % of storm water overflows in the system have been classified for their significance?	100%	0		If the answer is **No,** consider a review of each discharge within the sewer network complete and Query 3.11. If the answer is **Yes**, proceed to Query 3. 6
3.4	Have samples from any Secondary Discharges within the system been analysed ?	No	30		Select N/A if no secondary discharges in system. If the answer to Query 3.4 is **No**, consider examining the quality of each secondary discharge within the sewer network complete Query 3.11. If the answer is **Yes**, proceed to Query
3.5	What percentage of discharges from the system are known to cause environmental pollution of the receiving waters ?	21 - 30%	30		If the answer is greater than 50% then detail, in the AER, the Improvement Programme necessary to reduce this percentage.
3.6	In relation to possible exfiltration has a risk analysis of ground water contamination or pollution been undertaken ?	No	20		Select N/A if answer to Query 3.1.4 is NO. If the answer is **No**, consider undertaking ground water risk analysis and complete Query 3.12
3.6.1	If Answer to Query 3.6 is "Yes", have any groundwater aquifers been identified in the area of the Network and/or Discharge Points?	No	0		Select **N/A** if no risk analysis of groundwater contamination has been undertaken.
3.6.2	If Answer to Query 3.6.1 is "Yes", state the classification of groundwater aquifer identified in the area?	N/A	0		Select **N/A** if no risk analysis of groundwater contamination has been undertaken.
3.6.3	In relation to Query 3.6.1, is the aquifer used as a source for Public, Private or Group Water Supply Schemes?	No	0		Select **N/A** if no risk analysis of groundwater contamination has been undertaken.
3.7	Has an Impact Assessment of each Storm Water Overflow been undertaken in accordance with the DoEHLG paper "Procedures & Criteria in relation to Storm Water Overflows" including setting performance criteria?	Yes	0		If the answer is **No**, consider assessing the risk category of the receiving waters. If the answer is **Yes**, proceed to Query 3.8 and provide summary details of the assessment in the AER.
3.8	What percentage of storm water overflows comply with the performance criteria referred to in Query 3.7?	11 - 50%	40		Select N/A if answer to Query 3.7 is **No** or if there are no SWOs in system. **(Risk Score is locked at 0 if no SWOs in system is stated in Agglomeration Details)**
3.9	Have the causes of these Capacity Deficiencies (storm water overflows & Secondary Discharges) been identified ?	Yes	0		Select N/A if answer to Query 3.7 is NO or if there are no SWOs in system. If the answer to Query 3.9 is **No**, consider further examination of the environmental model
		Total Risk Assessment Score (RAS)	**248**		
3.10	Prepare Assessment of Needs & Sewer Upgrade Implementation Plan	In the AER Attach Assessment of Needs and Rehabilitation Implementation Plan as separate documents			
3.11	Provide Summary Details (in the AER) of records upstream and downstream of licenced discharges with regard to Environmental Performance of the network. These details can be included as part of the AER submitted for the agglomeration.				

Section 4.1 Structural Risk Assessment

Query	Description	Prompt	Risk Score	Short Commentary by the Local Authority	Comment or Action to be Taken
4.1	**Has a CCTV Survey been undertaken in accordance with WRc Documentation "Model Contract Document for Sewer Condition Inspections" and "Manual of Sewer Condition Classification" ?**	Yes	0		If the answer is **No** assess the need and benefit of undertaking CCTV Survey. If **Yes** Proceed to Query 4.2
4.1.1	How many years has it been since the **completion** of the CCTV Survey?	less than 5	0		If no CCTV has been undertaken, select "N/A" response
4.2	**What was this CCTV Survey Information Used for?**	Minimal Survey to Determine extent of Problem Sewers	5		Select N/A if answer to Query 4.1 is NO.
4.3	**Has the CCTV Survey been used to Assess the Structural Condition of the Sewer Network or targeted sections of the Sewer Network?**	Yes	0		If no CCTV has been undertaken, select "No" response. If the answer is **No** assess the need and benefit of undertaking an assessment of the Structural Condition of the Sewer Network. If the answer is **Yes** proceed to Q
4.4	**Have Performance Criteria been developed to determine the short, medium or long term structural condition of the sewer network ?**	Yes	0		If the answer is **No**, enter "unknown" in response to Queries 4.4.1 to 4.4.5; consider assessing the Future Needs of the Sewer Network. If the answer is **Yes** proceed to Queries 4
4.4.1	What % of the Total Sewer Length contains Collapsed or Imminent Collapse of Sewers (Grade 5)	5%	17		Insert Percentage of Overall Network Length; If a sewer length contains a Grade 5 collapse, include the total length of that sewer in calcuating the %. If information is not available type "Unknown" into Prompt Box
4.4.2	What % of Total Sewer Length contains Sewers Likely to Collapse (Grade 4)	10%	12		Insert Percentage of Overall Network Length; If a sewer length contains a Grade 4 condition, include the total length of that sewer in calcuating the %. If information is not available type "Unknown" into Prompt Box
4.4.3	What % of Total Sewer Length contains sewers with Further Possible Deterioration (Grade 3)	20%	7		Insert Percentage of Overall Network Length; If a sewer length contains a Grade 3 deterioration, include the total length of that sewer in calcuating the %. If information is not available type "Unknown" into Prompt Box
4.4.4	What % of Total Sewer Length contains sewers with Minimal Collapse (Grade 2)	40%	5		Insert Percentage of Overall Network Length; If a sewer length contains a Grade 2 feature, include the total length of that sewer in calcuating the %. If information is not available type "Unknown" into Prompt Box
4.4.5	What % of Total Sewer Length contains sewers of Acceptable Structural Condition (Grade 1)	unknown	5		Insert Percentage of Overall Network Length. If information is not available type "Unknown" into Prompt Box
If all % lengths are known, Check Total Length = 100%			**45**		If answers to Queries 4.4.1, 4.4.2 or 4.4.3 are above a set level, the RAS for Query 4 is automitically set at the maximum of 140.
4.5	**What % of the deficiencies, as detailed in Items 4.4.1, 4.4.2 and 4.4.3, have been rectified ?**	0 - 10%	35		Select N/A if answer to Query 4.4 is **No**. If the answer is **No**, Proceed to Query 4.6 If the answer is **Yes**, what monitoring is in place to ensure continued acceptance of structural condition? Proceed to Query 4.7
4.6	**Have the causes of the Structural Deficiencies (Grades 3, 4 and 5) been identified or is there a Preventative Maintenance Programme in place?**	No	10		If the answer is **No**, consider further examination of the sewer network, the structural loading conditions, gradients and possible H_2S Formation. If Yes completed Query 4.7
		Total Risk Assessment Score (RAS)	**95**		

4.7	**Prepare Assessment of Needs & Sewer Rehabilitation Implementation Plan**	In the AER Attach Assessment of Needs and Rehabilitation Implementation Plan as separate documents

Section 5.1 O&M Risk Assessment					
Query	**Description**	**Prompt**	**Risk Score**	**Short Commentary by the Local Authority**	**Comment or Action to be Taken**
5.1	Are complaints of an environmental nature recorded and held in a central database?	Yes	0		Consider setting up Central Database for Complaints
5.2	Is there an emergency response procedure in place?	Yes	0		Consider setting up target response times for dealing with Complaints
5.3	What has been the highest frequency of flooding in the network due to hydraulic inadequacy, over the past 5 years?	More than 5 times/yr	20		Refers to flooding from the Network only, not natural flooding from rivers/streams/high tides. Select the highest number of events in any 12 month period.
5.4	What has been the highest frequency of flooding in the network due to operational causes over the past 5 years?	More than 5 times/yr	20		Refers to flooding from the Network only, not natural flooding from rivers/streams/high tides. Select the highest number of events in any 12 month period.
5.5	What has been the highest frequency of surcharging of critical sewers in the network, over the past 5 years?	More than 5 times/yr	20		Select the highest number of events in any 12 month period.
5.6	What has been the highest frequency of reportable incidents in the network, over the past 5 years?	4 times/yr	15		Select the highest number of events in any 12 month period.
5.7	What has been the highest frequency of reportable incidents due to discharges, for whatever reason, from Pumping Station Emergency Overflows in the network, over the past 5 years?	3 times/yr	6		Select the highest number of events at any given Pumping Station in any 12 month period.
5.8	What has been the highest frequency of blockages in sewers in the network over the past 5 years?	>0.25/km/yr	20		Select the highest number of events per km of sewer network in any 12 month period.
5.9	What has been the highest frequency of collapses in sewers in the network over the past 5 years?	More than 5 times/yr	20		Select the highest number of events in any 12 month period.
5.10	What has been the highest frequency of bursts in rising mains in the network over the past 5 years?	Once/yr	4		Select the highest number of events in any 12 month period.
		Total Risk Assessment Score (RAS)	**125**		

5.11	Prepare Up Dated Operational and Maintenance Plan	

Section 6.1 Summary of Risk Assessment Scores

Element	Risk Assessment Score	Risk Category	% Risk Score	Maximum Risk Score
Section 2.1 Hydraulic Risk Assessment	140	High Risk	93%	150
Section 3.1 Environmental Risk Assessment	248	Low Risk	50%	500
Section 4.1 Structural Risk Assessment	95.31666667	Medium Risk	64%	150
Section 5.1 O&M Risk Assessment	125	Medium Risk	63%	200
Total RAS for Network	**608.3166667**	**High Risk**	**61%**	**1000**

If the total RAS is greater than 750, or if any of the individual RASs are greater than 75% of the Maximum Available Score, the Risk category for the Network is graded "High Risk"

Appendix 7.5 – Specified Improvement Programme

WasteWater Treatment Plant Upgrade.

The Cork City scheme is currently being reviewed and part of the review will include an assessment of nutrient removal requirements and impacts on shellfish waters. . It is proposed to undertake a review of the dispersion modelling of the discharge from Carrigrennan to assess potential impacts of the discharge from the wastewater treatment plant. The 2017-2021 investment plan also includes a proposal to provide nutrient removal at Carrigrennan. The 2017-2021 investment plan includes a proposal to provide UV treatment at Carrigrennan if the updated discharge modelling shows that it is necessary to protect the shellfish water quality.

A.3 & C.2: SD02 St Patrick's Bridge Culvert:

The project to identify the crossed and missed connections into St Patricks Culvert is underway. A consultant was appointed, and subsequently contractors also appointed, in 2015, to carry out surveys and identify sources of cross contamination into storm Culvert with a view to remediation. The surveys have commenced and are scheduled to be completed in Q3 2016. Once the findings are available a scheme for remediation will be drawn up to rectify the issues at fault.

C1: Infiltration programme:

Irish Water is progressing with a Network and Infiltration Review Project, with a view to constructing a verified hydraulic model of the entire wastewater network associated with the Cork City Agglomeration. The tender process to appoint a consultant to prepare the Drainage Area Plan (DAP) for the agglomeration is near conclusion. It is expected to appoint the Consultant in Q2 2016.

This model will be utilised to identify areas of tidal infiltration, existing and future capacity issues and potential misconnections between foul and storm networks.

The project will incorporate previous projects, i.e.

Tramore River Valley Study

Glanmire/Riverstown /Little Island Stormwater Seperation Study

The project will also give outputs for

C.1 *Improvement in operation of and reduction in frequency of Discharge via CSO71 (Carrigrennan WWTP),* as reductions in infiltration achieved through identification and resolution of issues in the Network will reduce frequency of overflows at WWTP

C3: Meet *Requirements of DoEHLG "Procedures and Criteria in relation to Storm Water Overflows" 1995* as it will quantify the overflows from each Storm Water Overflow and hence verify if they are problematic or not.

This Network Model Project and the Water Quality /Designation of Sensitive Waters review are the key items required to inform prioritisation of projects /address issues identified in the licence for the agglomeration.

Review of operation of Atlantic Pond and Ballinure Header Chamber

A review is underway by Irish Water of the operation of Ballinure Header Chamber and Atlantic Pond Pump Station, the largest pump station in the agglomeration. These are key items of infrastructure. It is expected that by optimisation of equipment together with upgrade of controls and Scada/ Telemetry, that improvements will be achieved in flow regimes to the WWTP. This should assist in reducing peak flows and also reduce some overflows from the WWTP.

The tender process is being finalised and a contractor is at the point of being appointed. The contractor will be appointed in Q1 2016 to undertake the upgrade works.

Ref C1. I*mprovement in operation of and reduction in frequency of Discharge via CSO71 (Carrigrennan WWTP).*

Suppressed Capital Maintenance Programme

Replacement of Failed and Failing assets, e.g. Pumps, Flow meters, Non return valves, Sensors, Electrical equipment, Telemetry etc. Are continuing steadily under IW . These programmes assist greatly in delivery of sustainable operational and maintenance service.

Appendix 7.6 – Priority Substances Monitoring Review

Table of Contents

Introduction

Priority Substances Monitoring has been carried out for D0033-01, Cork City, in County Cork in accordance with the requirements of 4.12 of the wastewater discharge licence for the agglomeration.

The Environmental Protection Agency undertook an Effluent Characterisation with consultants Mott MacDonald Ireland Ltd, and 88 pollutants, (including all the priority substances) were monitored on a quarterly basis at 11 WWTPs around Ireland, including Cork City WWTP. This study's objective was to determine which pollutants are likely to be found in Irish WWTPs and also to refine the UWW Calculation Tool for PRTR reporting purposes.

It was agreed with the EPA that Cork City did not have to carry out further sample testing for the Priority Substances, i.e. Organic Compounds and Metals, as this testing was included in the Effluent Characterisation monitoring for Cork City WWTP. The final report for this WWTP Characterisation was produced in July 2012.

A summary of the findings of the report with relevance to Carrigrennan WWTP was attached in **2012 AER Report as Appendix 1: Priority Substances.** The **2013 AER** reported on the requirement for a monitoring programme under paragraph 4.12 and schedule B1 note 3 of the licence.

1.1 2013 Assessment Conclusion

The results of the WWTP Characterisation were reviewed against the Annual Average Environmental Quality Standard (AA-EQS) for Other Surface Waters as set out in Tables 10 to 12 in S.I No.272 of 2009 and as amended in S.I. No. 327 of 2012.

No impact on the Receiving Waters was identified from the substances tested.

The majority of parameters were below the Annual Average Environmental Quality Standard (AA-EQS) for Other Surface Waters as set out in Tables 10 to 12 in S.I No.272 of 2009 and as amended in S.I. No. 327 of 2012.

Overall it was considered that given the location of the outfall from the WWTP in the Lower Estuary there is adequate dilution for the concentration of substances where detected above the Annual Average Environmental Quality Standard.

From the review however, four substances are recommended to be tested on an annual basis to verify that there is no deterioration in effluent quality.

1) **Cyanide** presented as exceeding the AA-EQS (Other) in two samples of effluent of four tested at levels of 22 and 16, Vs standard of 10 ug/l.

2)**Zinc** had one exceedance at 45.4 ug/l Vs AA-EQS (Other) standard of 40 ug/l.

3) **Nonylphenol and Nonylphenol Ethoxylates** (NP/NPEs) had one test value of the four above the AA-EQS (Other) standard of 0.3 ug/l. This test result was however at a level of 3.65 ug/l which warrants further test, in particular given the type of industries adjacent to the WWTP.

4)**Di(2-ethylexyl)phthalate** had all four test values below the AA-EQS (Other) standard of 1.3 ug/l, the highest test value coming in at 1.11 ug/l. It is close enough to the standard to warrant retest on an annual basis in conjunction with the other three substances above.

1.2 Monitoring 2014

Samples were collected and tested in November 2014 from the influent and Effluent at the WWTP, together with a sample at both High and Low tide from each of the 5 ambient monitoring locations in the harbour, a total of 12 samples in all. These samples were tested for a total of 13 Priority Substances. Given the number of industries feeding into the WWTP it was considered that it would be expedient, since sampling and analysis was being carried out in any event, to extend the range of parameters to encompass those likely to be a source of concern for the WWTP and the receiving waters.

Some parameters in 2014 testing had inlet values higher than those of the Characterisation study, notably PAH Total and 4- Nonylphenol branched, and DCM and Phenols exceeded those of the Characterisation study by a factor of 10.

Given that, as in the 2013 assessment, No impact on the Receiving Waters was identified in 2014 from the substances tested, no testing of the receiving waters was carried out in 2015.

1.3 Monitoring 2015

Samples were collected and tested in November 2015 from the influent and Effluent at the WWTP. These samples were tested for **Zinc, Glyphosate, PAHs, Nonylphenols** and **DEHP**. The Results are tabulated in Table 7.7.1 over

1)**Cyanide** was not tested in 2015

2)**Zinc** results in 2015 were directly comparable to the results of 2014 testing. Effluent in 2015 at 36 ug/l microgramme/litre was within the S.I. 272 /2009 AA-EQS (Other) standard of 40 ug/l.

3)**Glyphosate** results were similar to 2014, and all less than the limit of detection.

4)**PAHs:** Anthracene, Benzo(a)pyrene, Flouranthene, and Napthalene were all below the AA-EQS (Other)limits of S.I. 327/2012. However the sum of benzo(b)flouranthene and benzo(k)flouranthene at 0.032 ug/l marginally exceeded the AA-EQS (Other) limit of 0.03 ug/l. Similarly the sum of benzo(g,h,i)flouranthene and indeno(1,2,-cd)pyrene at 0.108 ug/l exceeded the value of 0.002 ug/l for the AA-EQS (Other) limit of S.I. 327 /2012 .

5) **Nonylphenol and Nonylphenol Ethoxylates** (NP/NPEs) monitoring results were all inconclusive, being less than limits of detection.

6)**Di(2-ethylhexyl)phthalate** result for Effluent at 2.2 ug/l exceeded the AA-EQS (Other) limit of S.I. 327 /2012 of 1.3 ug/l. The Influent value was directly comparable to that detected in 2014, but in 2015 no major improvement was detected over the treatment process.

1.4 Comparison and Conclusions

Zinc: Measured value of Influent in 2015 at 73 ug/l is typical of an influent under the influence of Tidal infiltration. This compares directly with value of 77 ug/l detected for Influent in 2014. In both 2014 and 2015 Effluent levels for Zinc improved through the treatment process, to 28 ug/l and 36 ug/l respectively, within the allowed AA-EQS Value .

Glyphosate: No issues and no change between 2014 and 2015.

PAH: There are questions about the results of the PAH testing. All results for Effluent were higher than the Influent, apart from Naphthalene. The overall PAH total (EPA 16) for Effluent at 0.730 ug/l was four times that of the Influent at 0.176 ug/l. This could be explained by the variation in inflows to the WWTP from local industries carrying out batch processes. Sampling was carried out on a Tuesday to attempt to overcome this issue but there is still a chance that effluent discharges did not reflect the equivalent inflows to the plant on the date in question. Further testing, possible mid week, is recommended as a cross-check on results and to verify exceedences where they may occur.

Nonylphenol and Nonylphenol Ethoxylates: Further testing is recommended to a lower limit of detection to verify the effect of inflows to the WWTP. Given the high <LOD result of monitoring it was decided not to include the results in the PRTR as the value of half the LOD to be used could scew the PRTR report without proper substantiation.

Di(2-ethylhexyl)phthalate: Influent values for 2014 and 2015 are directly comparable. Further testing is recommended to verify the values in the Effluent given the exceedence for effluent detected.

1.5 Table 7.6.1– Inlet and Discharge Priority Substance Data

		Priority Substances Assessment 2013 AER		Priority Substances Review				AA : Annual Average MAC: Maximum Allowable Concentration			
				November 2014		November 2015		S.I.327 of 2012		S.I. 272 of 2009
