

Attachment D 2.4 Waste and Material Outputs from Waste Activities.

The site currently accepts C&D waste, primarily household skip waste and residual household MSW and food waste. These wastes are bulked up and sent to other waste management facilities for treatment. Loose and baled SRF produced at other waste management facilities is accepted and stored at the site. The loose SRF is stored inside the building while the bales are stored in a designated open area.

The proposed IBA processing will recovery metals that will be sent to off-site recycling facilities and ash, which will be sent to non-hazardous landfill for disposal/recovery.

The facility operations generate small quantities of office type wastes. SEHL operates a source segregation policy to maximise the recovery of potential recyclable materials from these wastes. The mobile plant is subject to on-site maintenance and the waste oils and batteries generated during maintenance are removed off-site for disposal/recovery at licensed treatment/recovery facilities.

The oil interceptor on the surface water drainage system is routinely cleaned and emptied and the contents removed off-site for disposal/treatment at an appropriately licensed site.
