

E.3 Emission to Sewer

The surface and foul water drainage system are shown on Drawing No.001. As discussed in Attachment E.2, the rainwater run-off from the building roofs, car parks and areas of the yard where waste were not stored, that used to discharge to the municipal storm water sewer is currently diverted to the foul sewer serving the Business Park.

Floor wash water from the Materials Recovery building, wash water from the vehicle cleaning area and run off from hard-standing associated with waste handling, storage and processing discharges to the foul sewer serving the Business Park via a silt trap and oil interceptor.
