

## **Industrial Emissions Licence Application**

### **Connolly's RED MILLS**

#### **Application Ref. – LA001443**

##### **Section 4.4 – Capacity**

As part of the Industrial Emissions Licence Application the capacity of the site was calculated based on the current production capacity and the capacity of the site if it was to operate on a 24 hour basis, 7 days per week, 365 days per year.

The site has a current throughput of approximately 200,000 tonnes per annum based on the current work patterns at the site.

If the site was to operate on a 24 hour basis, 7 days per week, 365 days per year it is estimated by Red Mills that their capacity would increase to approximately 300,000 tonnes per year. This would also be dependent on market forces.
