

Capacity

The dry recyclable processing line involves recovery activities R03, R04, R05 and R12. The existing plant and equipment has the capacity to process the additional 18,000 tonnes/year. The larger of the two extension will accommodate the handling of the additional waste intake inside the building. The smaller extension will accommodate the future reconfiguration of the processing lines. A waste storage plan has been prepared that specifies the maximum amount of unprocessed and processed waste on-site at any one time and identified the designated storage areas.
