

Attachment-4-3-3-Waste Merchant and Treatment

The primary waste activities at the Drehid WMF will be in respect of the acceptance of waste materials on a commercial basis from waste operators for disposal to the MSW Landfill, Non-Hazardous Landfill, Hazardous Landfill and the Compost Facility.

In addition to accepting waste into the site from commercial sources, some waste quantities generated on-site will be treated and disposed of on site. These include thickened sludge from wastewater treatment at the leachate treatment facility which is suitable for disposal to the MSW or Non-Hazardous Landfill and municipal wastes generated in the offices, i.e. mixed non-recyclable waste will be disposed of to the MSW Landfill and organic waste will be sent to the Compost Facility for recovery.

The output from the Compost Facility is also retained on-site and primarily used as a cover material on the MSW Landfill and (in future) on the Non-Hazardous Landfill. The biostabilised output from the Compost Facility is not, however, considered as a waste.
