INTRODUCTION 1

This report has been prepared to detail the engineering solutions to roads, drainage and water supply as part of a planning submission for the development of a consolidated operations depot for Dublin City Council (DCC) north city operations including Waste Management, Housing Maintenance, Electrical Services and Public Lighting, Traffic, Surface Water Maintenance and Road Maintenance. The Operations Depot will be located on Saint Margaret's Road, Ballymun, Dublin 11.

The development is to provide a centralised Operations Depot for Dublin City Council to cover the north of Dublin City and will accommodate the following Operations Departments:

- Housing Maintenance;
- Roads Maintenance (to include winter salting); •
- Traffic management;
- Waste management (street cleaning); •
- •
- Public Lighting Management and Maintenance, and Domestic Waste Troopf •
- Domestic Waste Transfer (Civic Amenity Site) •

To provide for all of the above Departments Operations the following facilities are to be provided:

- Civic Amenity Site and associated office/welfare facility (for receiving segregated domestic waste for onward transfer and disposal);
- Central Stores building (for receipt and dispatch of materials necessary for the various • operational departments (building materials, Personal Protection Equipment, janitorial supplies, spares etc);
- Workshops (blacksmith/metal working, carpentry, small equipment repairs, painting, signage);
- Vehicle Workshop (3 bay facility for routine repairs/replacement of minor equipment)
- Street Waste compaction; •
- Vehicle garage (for vehicles containing water);
- Multi-Storey car park (for small fleet vehicles and private vehicles associated with Depot); •
- Main Administration Office and Welfare/Training. •

This report should be read in conjunction with the watermain, roads, foul and storm design drawings (refer to Appendix 1 for list of drawings to accompany this planning package) as

outlined and noted herein. In preparation for this planning application the following re-planning meetings took place on the following dates:

- 15/05/2017 Tom O'Connor, Fergus Finch, Patricia Cadogan and Peter Byrne
- 20/07/2017 Rita McGrath, Patricia Cadogan
- 11/09/2017 Fergus Finch, Sean McGrath, Diarmuid and Patricia Cadogan
- 28/09/2017 Fergus Finch

It is proposed to have access / egress to the Civic Amenity Centre via R104 along the southwestern boundary of the site. Staff access / egress is proposed on St. Margaret's Road to the east of the site and Fleet access / egress is proposed to the north of the site as detailed in Section 6 of this report and shown on Tobin drawings NCOD-TOB-ZZ-XX-DR-CE-2010 to 2042.

This report details the foul and storm drainage design and the water mains for said development. The site to which this planning application relates to encompasses approximately 5.03Ha of land, is a green field site and has a boundary on all sides.

It is proposed to discharge the foul effluent generated by the proposed development to the existing 750mm public foul sewer which runs east along St. Margaret's Road towards R108. Details of the foul drainage are outlined in detail in Section 4 below and in Tobin drawings NCOD-TOB-ZZ-XX-DR-CE-2010 to 2015.

It is proposed to discharge the storm water generated by the proposed development to the existing 900mm public storm sewer which runs east along St. Margaret's Road towards R108. The controlled discharge flow rate for the entire site will be set at the allowable Greenfield run off rate of 53.55l/s (Qall) or 14.2 l/s/Ha as detailed in Section 3 below and Tobin drawings NCOD-TOB-07-XX-DR-CE-2010 to 2015.

It is proposed that the watermain for the development will connect to the existing 300mm MOPVC public watermain located to the north of the site along St. Margaret's Road.

2 WATER SUPPLY

2.1 POTABLE WATER SUPPLY

It is proposed to connect a new 250mm diameter PE watermain to the existing 300mm diameter watermain on the north boundary of the site along St. Margaret's Road as shown on Tobin

drawings NCOD-TOB-ZZ-XX-DR-CE-2020 to 2022. This new watermain is to include boundary boxes with integral stopcocks at the connections. Provision is also to be made for the installation of bulk flow meter chambers.

There will be two categories of water user's on-site, full time staff and fleet staff/visitors. Full time staff water usage is estimated at 60l/day/person according to Table 3 of the EPA Design Manual – Treatment Systems for Small Communities Business, Leisure Centres and Hotels. Fleet staff will only be using water periodically. As such an allowance of 20 l/per//day has been allowed for fleet staff and visitors to site. A pre-connection enquiry was issued to Irish Water on 31/07/17. Irish Water concluded that "based upon the details you have provided with your pre-connection enquiry and on the capacity currently available as assessed by Irish Water, we wish to advise you that, subject to a valid connection agreement being put in place, your proposed connection to the Irish Water network can be facilitated". A copy of this letter is included **Appendix 3**.

To ensure all parts of the building footprints within the site are within 46m of a fire hydrant, hydrants will be located around the development in addition to existing hydrants located along St. Margaret's Road. All hydrants are within a minimum distance of 30m to a vehicle access roadway or hard-standing area for fire appliances according to Part B of the Building Regulations. Hydrant locations are shown on drawing NCOD-TOB-ZZ-XX-DR-CE-2020 to 2022. Two water storage tanks for fire fighting purposes have also been provided to supply a flow rate of 1500 l/min as per PS 9990. These are shown on drawing NCOD-TOB-ZZ-XX-DR-CE-2020 to 2022 which are included in this planning package.

3 SURFACE WATER

3.1 GENERAL

Irish Water records indicate a 900mm diameter surface water (SW) pipe east of the site on St. Margaret's Road. A new on site surface water drainage system has been designed in accordance with the Greater Dublin Strategic Drainage Strategy (GDSDS) and the Greater Dublin Regional Code of Practice for Drainage Works. It will ensure surface water discharge from the site is limited to the allowable greenfield runoff rate (Qall) of 53.55l/s or 14.2 l/s/Ha, in accordance with GDSDS, through a combination of attenuation storage tanks, permeable paving and a green roof. All surface water to the attenuation system will discharge to the existing surface water drain via a fuel/oil separators and vortex type flow control chambers.

The storm drainage for the entire development has been designed using the Micro Drainage's Windes Drainage design Software and in accordance with the Recommendations for Site

Development Works for Housing Areas and also the recommendations of the Greater Dublin Strategic Drainage Study (GDSDS). The details of the Micro Drainage outputs for the pipe designs and associated long sections are outlined at **Appendix 6** of this report. The storm water drainage has been designed to cater for surface water from public hard surfaces in the proposed development including roadways, footpaths, and the proposed building.

The drainage network has been designed so that the network pipelines and manholes will not be surcharged as a result of the critical 2-year critical rainfall and will not overflow as a result of the critical rainfall with a 30-year and 100-year storm return period intensity. The most up-to-date rainfall intensities for the site area have been derived from Met Eireann. 20% climate change has been implemented in the attenuation capacity design.

Refer to drawings NCOD-TOB-ZZ-DR-CE-20110 to 2015 for drainage drawings and **Appendix 4** for attenuation calculations.

3.2 SUDS (SUSTAINABLE URBAN DRAINAGE SYSTEMS)

The general principal behind SUDs is to reduce the guantity and increase the quality of water leaving the site. In practice a calculation for the site runoff is carried out using the Institute of Hydrology report No. 124. This gives the limit for discharge from the site.

In accordance with the GDSDS (Greater Dublin Strategic Drainage Study), underground storage is provided for the 1 in 30 year storm with on site attenuation provided for the 1 in 100 yr storm, to ensure that there is no flooding of the buildings. A flood risk assessment is carried out to ensure that there is no risk of damage to property or people and to mitigate against flood risks, flood routing is designed into the site layout. A flood risk assessment was carried out and is included in the planning documentation.

Typical types of SUDs which may be used are Infiltration systems (Infiltration trenches, Soakaways and Permeable paving), Attenuation systems (Attenuation tanks and Proprietary systems), Attenuation Ponds, Detention Basins, Rainwater harvesting and Green Roofs.

Types of SUDs devices, which may be applicable to this development;

Given the development is to be constructed on a greenfield site, the following SUDs approach have been reviewed and found to be suitable for the site, subject to detail design.

The SUDS strategy adopted was to divide the site into three seperate SUDS Zones, each with its own geocellular tank, fuel/oil seperator and vortex type flow control chamber. Each of these zones will then disharge the clean storm water to a trunk main at the controled rates. This trunk main will then discharge to the public storm sewer. The SUDS Zone hardstanding areas draining to the network are as follows;

Zone 01 – 0.42Ha Zone 02 - 1.44Ha Zone 03 – 1.92Ha

Attenuation

The geocellular attenuation systems units have been designed for storm periods with rainfall intensities taken for up to the 100 years return period. The proposed stormwater drainage ex ty systems in each of the SUDS Zones will be restricted by vortex type flow control chambers to the following allowable Greenfield Runoff (Qall) rates;

Zone 01: 5.97 l/s Zone 02: 20.40 l/s Zone 03: 27.18 l/s

This gives a combined Qall of 14.14 (18) ha or 53.55 I/s to the existing public surface water network to the east of the site. Conser

Bypass Separator

It is proposed to install bypass fuel/oil separators as shown on drawings NCOD-TOB-ZZ-XX-DR-CE-2010 to 2015. The stormwater from the external paved areas will include run-off from the car park and therefore may have hydrocarbons within their flow. These hydrocarbon pollutants require removal so they are not discharged back into the environment. The separators have been sized to cater for the total external paved areas. The location of the separators is shown on drawings NCOD-TOB-ZZ-XX-DR-CE-2010 to 2015 with typical details included in Appendix 7 of this report.

From the selection tables in the Separator Product Brochure in Appendix 7, the following separators or similar will be required;

Zone 01: NSBE 010 Zone 02: NSBE 030 Zone 03: NSBE 040

These are required to cater for the hydrocarbons which may be present in the stormwater collected from this site. These separators are designed to cater for the following approximate areas which show that the separators are in fact slightly over designed;

Zone 01: 5560m2 or 0.556Ha Zone 02: 16670m2 or 1.667Ha Zone 03: 22222m2 or 2.22Ha

Permeable paving

It is proposed to use permeable block paving in sections of the staff car park bays. This will consist of a layer stone of gravel with a voids ratio of 40% approximately 0.5m in depth with a impermable geotextile lining under our typical surface courses. required for an

Greenroof

It is proposed to use a sedum greenroof over the Office Building in the North East corner of the site. This is shown on Tobin drawings NCQD-TOB-ZZ-XX-DR-CE-2010.

RAINWATER HARVESTING 3.3

Storm water from a designated section hard-standing area of the proposed site will discharge to a rainwater harvesting tank (RWHT) via Fuel/Oil Separator located to the south of the proposed Office Building. Stored water will then be distributed by pump to the vehicle wash area when required. A stopcock non-return valve will be provided to prevent backflow and overflowing of the tank. A Kingspan or similar underground commercial rainwater harvesting tank will be used. The location of the proposed tank is shown on the drainage layout drawing NCOD-TOB-ZZ-XX-DR-CE-2010 while details of a typical rainwater harvesting tanks are included in Appendix 8.

FOUL WATER 4

4.1 GENERAL

An existing 750mm diameter foul sewer pipe is present running along St. Margaret's Road to the east of the site. It is proposed that the foul drainage from the proposed development will discharge to this existing 750mm diameter sewer. On-site, there will be two sources of effluent to the foul network, staff/visitors and effluent from the road sweepers/gully trucks. The discharge from staff/visitors is divided further into full time staff and fleet staff/visitors as was the case with the potable water demand calculations.

Foul Sources are as follows:

- 1. Staff/visitors
 - i) Full Time Staff
 - Fleet Staff/Visitors ii)
- 2. Effluent from the road sweepers/gully trucks.

only any other 4.2 OCCUPANCY FIGURES & WASTEWATER FLOW RATES

A pre-connection enquiry was issued to this Water on 31/07/17. Discharge figures and associated hydraulic and organic loadings from the staff and visitors of the proposed development are in accordance with The Environmental Protection Agency Wastewater Treatment Manual "Treatment Systems for Small Communities, Business, Leisure Centres and Hotels". A wastewater flow rate for full time staff of 60 litres/person/day and 30 BOD5 grams/person/day is assumed from Table 3 of the above manual. A wastewater flow rate for fleet staff/visitors of 20 litres/person/day and 15 BOD5 grams/person/day is also assumed.

Based on a desktop study, preliminary figures for effluent from the road sweepers and gully trucks were calculated. These figures were then issued to Irish Water as part of the preconnection enquiry. A copy of these calculations is included in Appendix 5. Irish Water concluded that "based upon the details you have provided with your pre-connection enquiry and on the capacity currently available as assessed by Irish Water, we wish to advise you that, subject to a valid connection agreement being put in place, your proposed connection to the Irish Water network can be facilitated". A copy of this letter is included Appendix 3.

Since this time, data has become available through testing of the effluent from similar sites which has resulted in more accurate flows and hydraulic and organic loadings from the trucks. Based

on these new figures the loading to the public system has been reduced when compared to the original figures. A copy of these calculations is included in **Appendix 5.**

Source		Hydraulic (Litres/Day)	Loading	BOD₅ Load ((Grams/Dav)	
Description Total Occupancy		Per Occupancy /truck	Total	Per Occupancy /truck	Total	P.E.
Staff/visitors	181 Full time staff 510 Fleet Staff/Visitors 8 Large Trucks	60 15 340	24,800	30 15 748	14,110	235
	6 Small Trucks	170	L.C.	281		

A summary of the total Hydraulic and Organic loadings based on the above is outlined below:

Table 4.2.1 – Summary of Hydraulic and Organic Loadings

Therefore, the total Hydraulic load for the proposed development is 24,800 litres per day and the proposed PE is 235. Calculations have been provided in **Appendix 5**.

NOTE: A co-ordination exercise was carried out taking into account existing services ensuring no clashes will be encountered between new and existing services.

Please refer to **Appendix 1** for drainage drawings.

5 SITE INVESTIGATIONS

Site Investigations were carried out by Causeway Geotech Ltd. Location of site investigations are shown on drawing NCOD-TOB-ZZ-XX-DR-CE-2001. A summary of the ground types encountered in the exploratory holes is listed below, in approximate stratigraphic order:

- **Topsoil:** encountered typically in 150-300mm thickness in most exploratory holes.
- Made Ground (sub-base): 50-200mm of aggregate fill (sandy silty gravel) present in borehole BH05 from ground level and trial pit TP09 beneath 200mm of topsoil.
- Made Ground (fill): reworked clay fill with localised pockets of debris encountered in the majority of boreholes and trial pits across the site. Typically, sandy gravelly clay with

fragments of brick, concrete, ceramic, glass, plastic and ash extending to a depth of 0.50-3.45m.

• **Glacial Till:** sandy gravelly clay, frequently with low cobble and occasional boulder content, typically firm or stiff in upper horizons, becoming very stiff with increasing depth.

In all infiltration tests (SA01- SA05), the rate of infiltration was very low. Only SA05 was able to be calculated with an infiltration rate of 0.068m/h. The low-permeability soils are considered as such poor infiltration media, and would be deemed unsuitable for the implementation of infiltration drainage systems. A copy of the Site Investigation report can be found in the *"Environmental Considerations Report"* that accompanies the Planning Application.

6 ROADS AND TRAFFIC

6.1 GENERAL

The design and layout of the internal access roads and parking areas have been developed with reference to the following:

- Design Manual for Roads and Streets (March 2013)
- NRA Design Manual for Roads and Bridges
- Traffic Signs Manual published by the DOE
- DTO Traffic Management Guidelines

The layout of the internal roads is shown Tobin drawings NCOD-TOB-ZZ-XX-DR-CE-2040 to 2042 with drawings showing junction layouts listed in Appendix 1 of this report. These drawings have included in the planning package.

Access and egress to the site is detailed below;

Northern Junction – Fleet Vehicle Access:

The Northern Junction is proposed as the fleet vehicle access / egress to the NCOD. It is located on St. Margaret's Road adjacent to the IKEA junction. The existing signalised 3 arm junction will be modified to a 4 arm signalised junction, with the NCOD accessible via the southern arm.

At this junction, St. Margaret's Road is an urban dual carriageway with a designated speed limit of 50km/h. The intervisibility at the signalised junction is in accordance with the requirements of the TII DN-GEO-03044 (January 2005).

Eastern Junction – Staff Access:

The Eastern Junction is proposed as the staff vehicle access / egress to the NCOD. It is located on St. Margaret's Road at the 90 degree bend, approximately 250m west of the junction of St. Margaret's Road with the R108. The existing junction is currently operation as a though flow junction. The proposed junction will be modified to a signalised junction with 3 active arms, while also retaining the existing southern arm spur for potential future development.

At this proposed junction, St. Margaret's Road is an urban dual carriageway with a designated speed limit of 50km/h. The intervisibility at the proposed signalised junction is in accordance with the requirements of the TII DN-GEO-03044 (January 2005).

Western Junction – Civic Amenity:

The Western Junction is a proposed new priority access servicing the civic amenity and will be the proposed public access to the civic amenity. The junction is located on the R104 a two-way single carriageway with a designated speed limit of 50km/h. The visibility splays are provided in accordance with the Design Manual for Urban Roads and Streets (March 2013) and are achievable in both directions. The visibility requirements are a 'x-distance' of 2.4m with a 'y-distance' of 45m.

Entry and exit to and from the Civic Amenity Centre will be from R104 along the south-western boundary of the site. Access to the remainder of the site will be from St. Margaret's Road on the eastern side of the site. A separate exit point will be designed on the northern boundary to assist with traffic flow and increase safety.

The proposed development is within a 50km/hr speed limit zone. The visibility splay of 2.4m x 45m is in accordance with Design Manual for Urban Roads and Streets. This visibility splay at the junctions is achievable in both directions.

Dedicated pedestrian and cyclist access points will be provided, ensuring separation from the vehicle access point. A Swept Path Analysis has been carried out and concluded no issues with the proposed road layout. Please refer to auto-track drawings in **Appendix 1** of this report.

7 WORKPLACE TRAVEL PLAN

In accordance with Fingal Development Plan 2017-2023 objective DMS 116, a workplace travel plan has been prepared for this planning application. Refer to the Workplace Travel Plan included in this planning application for further details.

10

8 ROAD SAFETY AUDIT

As per the scoping undertaken with the Local Authority's Transportation Planning Section, a Stage 1 Road Safety Audit has been undertaken for this planning application and is included as part of the planning package. A Stage 2 Road Safety Audit will be undertaken at Detailed Design.

9 TRAFFIC AND TRANSPORTATION ASSESSMENT

A Traffic and Transportation Assessment has been undertaken in accordance with the Traffic and Transportation Assessment Guidelines (May 2014). Scoping of the TTA was undertaken with the Transportation Planning Section. Development of the traffic generations and distributions has been prepared by TOBIN Consulting Engineer. Modelling of the NCOD associated junctions in LINSIG and preparation of the TTA has been undertaken by AECOM. Refer to the TTA included in the planning application documentation for details.

10 CONSTRUCTION ENVIRONMENTAL MANAGEMENT PLAN

For all details relating to the environmental baseline assessment, the potential impacts of the construction phase of the development as identified by the project environmental specialists and the mitigation measures proposed to negate the potential impacts, please refer to the *"Environmental Considerations Report"* that accompanies the Planning Application.

11 OUTLINE CONSTRUCTION TRAFFIC MANAGEMENT PLAN

An Outline Construction Traffic Management Plan has been prepared as part of this planning application in accordance with the relevant Chapters of the Traffic Signs Manual (November 2010). Refer to the OCTMP in the planning application for further details.

12 WATERMAIN DIVERSION

Pre-planning meetings were held with Irish Water (IW) on the following dates to discuss options for dealing with the existing 800mm diameter ductile iron mains that runs along the south side of the site;

- 3rd October 2017 In attendance were Anthony Mulligan (TOBIN), Craig Scully (TOBIN), Marina Zivanovic Byrne (IW), Conor Carey (IW) and Aidan Gallagher (DCC).
- 2nd November 2017 In attendance were Anthony Mulligan (TOBIN), Craig Scully (TOBIN), Marina Zivanovic Byrne (IW) and Aidan Gallagher (DCC).

Following these meetings it was agreed to carry out works on the mains that will keep the watermain a minimum of 5m from any structure. It was also agreed to avoid running the mains under any storage area and to keep the mains a minimum of 3m from the boundary wall. Where the mains will pass under a boundary wall on entering and exiting the site a structural solution was proposed and discussed with IW that will keep the wall and foundations a minimum horizontal distance of 5m from the mains. It is also proposed to replace the existing mains with a joint-less pipe in these areas to minimise the number of joints and reduce the need for maintenance in the future. Please see Tobin drawing NCOD-TOB-ZZ-XX-DR-CE-2110, which has been included in this planning application, showing the proposed works.

13 GAS LINE CROSSINGS

An existing 250mm diameter Gas main runs along the eastern and northern boundary of the site. We are proposing two locations where roads and services will cross this line. In order to provide adequate protection to the mains we have agreed a solution with Gas Networks Ireland that will allow our access roads and services to pass over and under respectively. Please see Tobin drawing NCOD-TOB-ZZ-XX-DR-CE-2120, which has been included in this planning package, for details.

Dear Sir/Madam,

Re: 1147376321 pre-connection enquiry - Subject to contract | Contract denied Connection for non-domestic premises at Saint Margaret's Road, Ballymun, Dublin 11

Irish Water has reviewed your pre-connection enquiry in relation to

water and wastewater connections at Saint Margaret's Road, Ballymun, Dublin 11 Based upon the details you have provided with your pre-connection enquiry and on the capacity currently available as assessed by Irish Water, we wish to advise you that, subject to a valid connection agreement being put in place, your proposed connection to the Irish Water network can be facilitated.

There is an existing 800mm HL watermain along south edge of the site. New connections for water and wastewater to the existing network are feasible subject to required diversion of the watermain being assessed as feasible.

Before completing the design of services infrastructure at the Premises (including diversion proposals), and prior to submitting any planning application, you are advised to contact Irish Water. The design has to be in

accordance with published Irish Water Code of Practice and Standard Details (for water and wastewater)

You are advised that this correspondence does not constitute an offer in whole or in part to provide a connection to any Irish Water infrastructure and is provided subject to a connection agreement being signed at a later date.

A connection agreement can be applied for by completing the connection application form available at **www.water.ie/connections**. Irish Water's current charges for water and wastewater connections are set out in the Water Charges Plan as approved by the Commission for Energy Regulation.

CorriPipe[™] Technical Specification

www.jfc.ie

EPA Export 21-06-2019:04:18:39

CorriPipe™ Technical Specification

1. Introduction

CorriPipe[™] is a twin wall high density polyethylene pipe manufactured from a blended black polyethylene by a twin extrusion process.

Two high density polyethylene walls are extruded simultaneously, one inside the other, and heat-welded together in one continuous process. The outer wall is corrugated and the inner wall is smooth finished.

It is a combination of the corrugations, and the heatwelding of the two walls, that give CorriPipe[™] its excellent structural strength while its smooth inner wall ensures increased flow capacity.

Its applications include surface and storm water drainage in civil engineering, construction, sports amenity, agricultural and other sub-soil applications.

CorriPipe[™] is fully BBA (British Board of Agrément) approved and HAPAS (Highways Agency Products Approval Scheme) certified.

Figure 1. – CorriPipe™

2. Dimensions

CorriPipe[™] comes in a complete range between 100m and 600mm and is available in either carrier of filter pipe. CorriPipe[™] also has a complete range of fittings and junctions as detailed below.

Nominal Size	Inside Diameter	Outside Diameter	Pipe Length
(mm)	(mm)	(mm)	(m)
94	94	110	6
150	149	176	6
225	221	265	6
300	295	354	6
375	370	426	6
450	445	512	6
600	590	680	6

CorriPipe™ Technical Specification

3. Hydraulic Capacity

There are two main formulas used in hydraulic calculations of gravity flow pipelines – Manning's and Colebrook-White:

Manning's

Manning's is the most popular equation for stormwater design because it is simple to apply and it generally provides an acceptable level of accuracy.

$$Q = \frac{1}{n} A R^{\frac{2}{3}} S^{\frac{1}{2}}$$

- Q = Water Discharge [m³/s]
- n = Manning's roughness factor [s/m1/3]]
- A = Cross-sectional area [m2]
- R = Hydraulic radius [m]

S = Surface Water Slope [m/m]

Colebrook-White

A more accurate method for calculations involving FRC[™] pipes is to utilize the Colebrook-White formula. The Colebrook-White design chart for FRC[™] should allow quick and easy estimates without involved calculations.

$$V = -2\sqrt{2gDS} \log\left(\frac{k}{3.7D} + \frac{2.51v}{d\sqrt{2gDS}}\right)$$

V = Velocity (m/s)

- S = Hydraulic gradient (m/m)
- k = Hydraulic roughness (m)
- R = Hydraulic radius = D/4 (m)
- D = Pipe internal diameter (m)
- g = Gravitational acceleration (m/s2)
- v = Kinematic viscosity of water (m2/s)

4. Cover Depths

Minimum Cover Depths

JFC Manufacturing Limited recommends the following minimum cover depths.

- 0.6m for non trafficked green areas
- 0.9m to finished surface for trafficked areas <u>not</u> subject to Highways Agency or National Roads Authority requirements
- 1.2m to finished surface for trafficked areas <u>subject</u> to Highways Agency or National Roads Authority requirements.

In certain circumstances lower minimum cover levels may be allowed. e.g. installation with rigid pavement, concrete surround etc. Please contact JFC for more information.

Maximum Cover Depths

The maximum cover depth for CorriPipe[™] is normally between 6-10 meters when installed in accordance with series 500 of the MCDHW Volume 1 as detailed in the CorriPipe[™] BBA certificate.

The actual maximum allowable cover level is dependent on the following installation parameters and is often well in excess of 6-10 meters:

- The native soil stiffness
- The pipe bed and surround stiffness
- The size of the trench
- The density of the overburden
- Hydrostatic loading
- Factor of Safety
- Maximum allowable deflection limit

For specific site conditions JFC can calculate the maximum pipe deflection based on the above parameters. Contact JFC for more details.

www.jfc.ie

CorriPipe™ Technical Specification

4. Installation

JFC CorriPipe is to be installed in accordance with the following national guidelines. In countries outside that specified contact JFC for more details.

Ireland

The Manual of Contract Documents for Road Works, Volume 1 series 500, clauses 503 and 505 as published by the NRA.

United Kingdom

The Manual of Contract Documents for Highway Works, Volume 1 series 500, clauses 503, 505, 518.7 and 518.8 as published by the Highways Agency

Trench Preparation

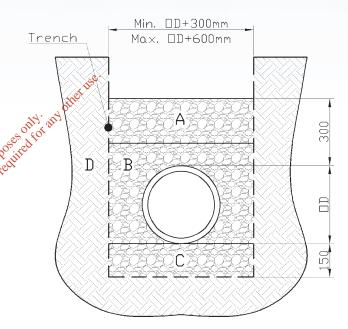

The trench width is generally between OD+300mm and OD+600mm but larger trenches are permissible. The trench should provide for a minimum of 150mm pipe bed and local soft spots must be removed and replaced with hardcore. The pipe must sit evenly option and the bed and must be free of voids under the pipe. The the bed and must be free of voids under the pipe. The trench should not be excavated too far in advance of pipe installation. All trenches are to be excavated in accordance with national health and safety regulations and local building regulations.

Sidefill

CorriPipe[™] is to backfilled as described in the MCDHW, Volume 1, Series 500. Sidefill material is dependent on specification but is normally a well graded granular material or small single size aggregate. The pipe surround material must fully support the pipe. Compaction may be required depending on ground conditions and sidefill material used. If compaction is required the compaction equipment must not come in contact with the pipe. The sidefill material should extend to 100mm over the crown of the pipe.

Backfill

Backfill is to continue to a minimum of 300mm above the crown of the pipe with suitable material as per specification. The material should be free of any stone particles greater than 50mm. Compaction should not be carried out until a minimum cover of 300mm is achieved. Compaction equipment should be sized so as not to exert any undue stress in the pipe. Further backfill to the required level should be carried out in layer no greater than 300mm.

A = Backfill
B = Sidefill
C = Bed
D = Earth
OD = Outside Diameter of Pipe

CorriPipe[™] Technical Specification

5. Jointing

CorriPipe[™] is manufactured in 6 meter lengths and is joined with straight couplers or suitable fittings (e.g. tees, wyes, bends etc.)

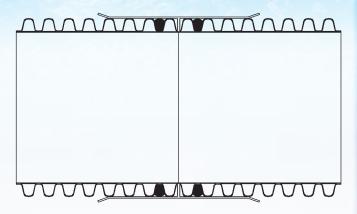

CorriPipe[™] provides a fully watertight seal when installed in accordance with JFC recommendations.

Leak tightness is in accordance with BS EN 1277:1997. The maximum permitted angular deflection is 2°.

Rubber seals used in watertight applications are in accordance with BS EN 681-1:1996

JFC recommends the following procedure for joining CorriPipe[™] and associated fittings / couplers.

- Cut the pipe to the require length with a conventional handsaw.
- Clean the end of the pipe and accompanying coupler / fitting.
- Install a ring seal in the first dwell of the pipe for watertight joints.
- Ring seals are bi directional
- Lubricate the ring seal and accompanying coupler / fitting.
- Offer the fitting / coupler up to the pipe
- Lever the fitting / coupler onto the pipe with a piece of timber ensuring not to damage the pipe. Larger pipes may require mechanical assistance.
- Ensure the fitting / coupler is butted fully against the pipe.
- For joining pipes to the opposite side of the fitting / coupler follow the same steps as outlined above.

6. Pressure Testing

There are two methods of pressure testing, the air test method and the water test method. The most common method is the air test method and the test procedure is outlined below.

- Block the ends of the pipe / fitting with a suitable expanding stopper, ensuring both plug and pipe are cleaned prior to fitting.
- Fill a U-Tube manometer with water to the correct level, ensuring there are no trapped air bubbles in the water.
- Connect the u-tube to the fitting on the expandable stopper.
- Increase the pressure in the pipe until a head of water of 100mm is reached.
- Allow the pressure to stabilise for a number of minutes, increasing the pressure if it drops.
- Record the pressure drop over a five minute period.
- To pass the test the pressure should not drop below a 75mm head of water.

Note: Temperature has a critical effect on the test, a 1°C change in air temperature inside the pipe is sufficient for the test to fail.

CorriPipe[™] Technical Specification

6. Transportation, Handling and Storage

General

Handling should be done carefully and in accordance with national health and safety guidelines. Dragging of pipes and fittings must be avoided. HDPE pipes and fittings become slippery in wet or in cold weather and extra precautions may be necessary.

Pipes up to 450mm in size are palletised with wooden frames and steel straps. 600mm pipes are generally steel banded in two's but can also be supplied loose.

		-					
Nominal Size							
(mm)	per Pallet						
100	100						
150	33						
225	14						
300	8						
375	375 5						
450	450 4						
600	600 2 / steel banded						
Tabl	e 4. – CorriPipe™ Pallet Quantities	OWNE					
	5 4 2 / steel banded e 4. – CorriPipe™ Pallet Quantities						

Storage

All materials should be carefully inspected at the time of delivery and any defects should be notified and reported immediately. All pipe stacks should be made on firm, flat ground to support the weight of the pipes and lifting equipment. For safety and Pipes and fittings should be transported and stored in their packaging.

Delivery vehicles should be provided with a clean, flat bed, free from sharp objects. Care must be taken to prevent slippage or excessive bowing of the pipes. Tie the load well to prevent rubbing. Use nylon straps, not chains or ropes.

The stacking height for pipes should be limited to not more than 3 meters. Pipes should be not be stored in open areas subject to high winds.

t is recommended that CorriPipe™ is not stored in direct sunlight for more than 3 months.

APPENDIX 7

Bypass Separator Details

Consent of copyright owner required for any other use.

Bypass NSB RANGE

APPLICATION

Bypass separators are used when it is considered an acceptable risk not to provide full treatment, for very high flows, and are used, for example, where the risk of a large spillage and heavy rainfall occurring at the same time is small, e.g.

- Surface car parks.
- н. Roadways.
- Lightly contaminated commercial areas.

PERFORMANCE

Klargester were one of the first UK manufacturers to have separators tested to EN 858-1. Klargester have now added the NSB bypass range to their portfolio of certified and tested models. The NSB number denotes the maximum flow at which the separator treats liquids. The British Standards Institute (BSI) tested the required range of Kingspan Klargester Bypass separators and certified their performance in relation to their flow and process performance assessing the effluent qualities to the requirements of EN 858-1. Klargester bypass separator designs follow the parameters determined during the testing of the required range of bypass separators.

Each bypass separator design includes the necessary volume requirements for:

- Oil separation capacity. Oil storage volume.
- Silt storage capacity.

the formula given by PPG3 NSB = 0.0018A(m2). Flows generated by the higher rainfall rates will pass through part of the second to the secon The unit is designed to treat 10% of peak flow. The calculated 80 the main separation chamber.

Coalescer.

Class I separators are designed to achieve a concentration of 5mg/litre of oil under standard test conditions.

FEATURES

- Light and easy to install.
- Inclusive of silt storage volume.
- Fitted inlet/outlet connectors.
- н. Vent points within necks.
- Oil alarm system available (required by EN 858-1 and PPG3).
- н. Extension access shafts for deep inverts.
- Maintenance from ground level.
- GRP or rotomoulded construction (subject to model). н.

To specify a nominal size bypass separator, the following information is needed:o'll

- The calculated flow rate for the drainage area served. Our designs . whited elsewhere on site does not impede flow into or out of the care based on the assumption that any interconnecting pipework
- The drain invert inlet depth.
- Pipework type, size and orientation.
