

4.8 Operational Report

No operations are proposed, and no licensable activity will be taking place at the subject site.

It is proposed that the material previously imported to the subject site at Grange Castle Golf Course remain *in situ* with no further movement of material or importation of additional waste material to the site.

This retention of the materials onsite is the subject of this EPA waste licence application and associated environmental impact assessment report.

There will be no processing of the existing material, no other activity will be taking place and no further waste will be imported/accepted onsite.

As no activities will be taking place, no methods, processes, ancillary activities, abatement, recovery and treatment systems, operating procedures, plans, process flow diagrams, reports or supporting documentation in relation to a proposed operation have been developed. No infrastructure will be developed, and no plant or machinery will be required on site.

Furthermore, as there will be no operational activity taking place or staff present at the site, no associated operational waste, such as canteen, office, and other waste streams will be generated.

Therefore, as no activity or operations will be taking place and no waste will be accepted onsite, a full operational report has not been developed.
