

Licence Alteration Request

Schedule B.1.3 of the licence specifies the emission limit values (ELV) and flow rates for the exhaust gasses from the on-site CHP Gas Engine (Emission Point A4). The flow rate is specified as 3000 Nm³/hour.

Monitoring carried out by Eras Eco has established that the flow rate is higher than the limit specified in Schedule B.1.3 and in response Eras Eco carried out an investigation into the cause. This has established that the 3,000 Nm³/hour limit set in Schedule B.1.3 appears to be a typographical error.

The flow rates for the CHP provided in Table E 1(ii) of licence review application was 6,200Nm³/hour, as confirmed in the response to item 35 of the Agency's Regulation 10 notification dated 16th December 2016. The response, which was received by the Agency on 16th March 2017, is in Attachment A.

The air dispersion modelling carried out by Odour Monitoring Ireland Ltd (OMI) to assess the impacts associated with the CHP Gas Engine was based on a flow rate of 6,200 Nm³/hour. A copy of the OMI report, which was submitted to the Agency in April 2017, is in Attachment B. The information on the flow rates is in Tables 3.4 and 3.5.

The application clearly indicated that the flow rate from the CHP Gas Engine would be 6,200Nm³/hour and the air dispersion modelling to assess the impact of the emissions was based on this flow rate. Ormonde Organics considers that the reference to a flow rate of 3000Nm³/hour in Schedule B.1.3 to be a clerical error and requests the wording of the Schedule to be altered to bring it into conformance with the information provided in the licence review application.
