

Waste activities involve both composting and anaerobic digestion; however the application form does not allow the entry of two R03 Activities. The total annual waste intake will be 80,000 tonnes and the distribution between composting and anaerobic digestion will depend on market conditions. For the purpose of this application anaerobic digestion will be the principal activity. The daily processing capacity is determined by the volumes of the digesters and the composting bays, details of which are in Attachment 4.3.2.
