Maximum Waste Storage Calculations

Starrus Eco Holdings Limited is applying for a licence review to increase the annual waste intake from 45,000 tonnes to 80,000 tonnes. This will involve the extension of the composting building to provide additional processing capacity.

The only activities carried out on the site are composting (R03 - Recycling/reclamation of organic substances which are not used as solvents (including composting and other biological transformation processes)). The average daily intake of material based on the proposed annual waste intake and the number of days operational (304 days) is 263 t/day. However, the maximum daily intake will be 450 t/day.
