

ATTACHMENT 7-1-3-1-Air Emissions Compliance Report

The baseline air quality based on EPA data is good. There are no statutory limits for air emissions for pig farms and therefore the facility is compliant with national legislation. However the facility will produce odour and significant fugitive emissions of ammonia, methane and nitrous oxide. These emissions are assessed in the attached emission impact reports.

The EPA license will require that there is no significant impairment of the environment outside the boundary of the facility. In the case of odour this is a subjective matter – the level of complaints in relation to odour is low.
