APPENDIX D MODELLING RESULTS		

1 INTRODUCTION

Irwin Carr Ltd have been commissioned to undertake air quality dispersion modelling for an existing pig farm at Mogeely, Co. Cork.

The purpose of this report is to quantify the ammonia and nitrogen levels at the ecologically sensitive areas in the vicinity of the pig farm.

The predicted impact can then be compared to an appropriate criterion and graphically illustrated in the form of 'contours of equal concentration' or isopleths which are superimposed on base maps.

1.1 Application Description

The site is currently has the provision for sixteen mechanically ventilated pig sheds which house a total of 19,910 pigs of varying size and type.

In order to accurately predict the ammonia impact from the site, all 12 sheds (with updated building names) have been included as part of this assessment as well as 3 on site slurry stores, for the purposes of an EPA licence application.

As part of this application, a low protein diet has been included, the associated reductions of which are included in Section 3.2.3 below.

In addition to the low protein diet detailed above, additional mitigation is also incorporated by way of the regular removal of slurry from the sheds. This slurry will be removed from the sheds in line with the Best Available Techniques (BAT) Reference Document and transported to covered slurry tanks located on site.

The reductions associated with this mitigation have been included on all sheds included as part of this assessment.

1.2 Application History

This report is further to an original assessment completed by Irwin Carr, as well as a consultation response from the EPA dated 1 November 2021. The EPA points in relation to ammonia are addressed in order below:

- a) *The existing licence includes a condition in relation to low protein feeds (condition 5.4). Therefore, the animals in the 'existing' houses should already be on low protein diets. Whilst it is noted that there may be further reductions of ammonia from the existing houses due to the incorporation of low protein feeds at 16% crude protein, it is not appropriate to incorporate the full reduction of 30% into the modelling for the existing houses;*

The reduction in low protein diet is based on the reduction from the baseline odour emission factor. Irrespective of the crude protein level currently being fed to the pigs, if it is sufficiently reduced below the baseline then the full reduction is applicable for the existing sheds.

- b) *It is further noted that the modelling includes a 25% reduction in ammonia emissions through the use of frequent slurry removal. With regards to the vacuum system for frequent slurry removal outlined in your response of 01 October 2021, provide further details on the sluice-based system onsite i.e. number, location and depth of the sluice gates and confirmation that a vacuum can be maintained in each tank (FS01 to FS18) to satisfy the requirements of the BREF and to provide justification of the 25% reduction for each tank;*

This point will be addressed by the applicant.

- c) *As per the EPA's notice of 05 August 2021 and your response of 01 October 2021, ensure all the animal houses and the storage tanks have the same nomenclature/numbering in the Air Quality Impact Assessment Report as the layout plans;*

Shed numbers have been updated as part of this additional assessment.

- d) *Ensure that the number, dimensions (and also nomenclature as mentioned above) of the external storage tanks outlined in the report correspond with the 'Mogeely Slurry Storage Available' document received on 01 October 2021;*

The shed dimensions have also been amended as part of this additional report.

- e) *With regards to point 2 above, update the modelling if necessary, once the type of cover is confirmed;*

It has been confirmed that both tanks will utilise a rigid cover, which has been accounted for in this assessment.

- f) *Provide justification for meteorological data used with regards to both wind speed and wind direction. Provide the source of the meteorological data, and specifically the wind speed data, for the site of the installation;*

Additional information is provided in Section 3.3 in relation to meteorological data.

- g) *Provide justification for the surface roughness factor used;*

The surface roughness factor has been updated and is based on the dominant land use type around the site- grassland.

- h) *The co-ordinates for House 15 are incorrect as they correspond to a location off-site). Update the report with the correct co-ordinates;*

Co-ordinates have been amended for the updated shed numbers.

- i) *Confirm that the stack heights for all houses correspond to the release heights outlined in the report. If not and taking into account that most of the development works are already complete, confirm whether houses will be retrofitted or amend the modelling to reflect the existing release heights;*

Stack heights in Table 19 correspond to the release height of each chimney.

- j) *The NIS states low protein feed will result in a 25% reduction in ammonia and does not mention frequent slurry removal which conflicts with the Ammonia Modelling Report. You are required to ensure that the information outlined in the NIS corresponds to the Ammonia Impact Assessment Report; and*

Mitigation measures for this site include both a low protein diet, as well as the frequent removal of slurry.

- k) *You are required to update your approach as necessary taking account of the EPA's guidance document "Assessment of the impact of ammonia and nitrogen on Natura 2000 sites from Intensive Agriculture Installations": <https://www.epa.ie/publications/licensing-permitting/industrial/ied/Assessment-of-Impact-of-Ammonia-and-Nitrogen-on-Natura-sites-from-Intensive-Agriculture-Installations.pdf>.*

In addition, the applicant has also provided additional information in the form of a letter than details how the number of pigs in each shed has been amended, as well as the building references, but the total number of pigs on site remains the same.

2 ASSESSMENT CRITERIA

The proposed target levels and method of assessment is described in this section.

2.1 Ammonia

There are limitations on emissions of ammonia from such installations for the protection of vegetation. They are referenced from *Cape, J.N.; van der Eerden, L.J.; Sheppard, L.J.; Leith, I.D.; Sutton, M.A.. 2009. Evidence for changing the critical level for ammonia. Environmental Pollution, 157 (3). 1033-1037.*

Where the limits are applied to general vegetation such as herbaceous species or forest trees the limit is set at $3 \pm 1 \mu\text{g}/\text{m}^3$ of ammonia (ie. 2-4 $\mu\text{g}/\text{m}^3$) as a long-term (several year) concentration.

For particularly sensitive plants such as lichens and bryophytes, the limit of $1 \mu\text{g}/\text{m}^3$ is applied to ammonia as a long-term (several year) concentration

Table 1 shows the target levels for the protection of vegetation.

Table 1: Ammonia limit values

Pollutant	Reason	Guideline Value	Measured as
Ammonia	Protection of Vegetation	1-3 $\mu\text{g}/\text{m}^3$	Annual Mean

2.2 Nitrogen Deposition

Critical load values for nutrient nitrogen deposition are provided by the United Nations Economic Commission for Europe (UNECE) as a range (e.g. 10-20 kg N/ha/yr for dry heaths). This table provides indicative values within the critical load range, by habitat type, for use in detailed impact assessments in Ireland.

Table 2: Critical Load Range for atmospheric Nitrogen

Habitat type (EUNIS code)	Critical load (CL) range (kgN/ha/yr)	Value to use at screening stage (kgN/ha/yr)	Recommended value to use at detailed assessment stage (kgN/ha/yr)
Marine habitats			
Mid-upper saltmarshes (A2.53)	20-30	20	20
Pioneer & low-mid saltmarshes (A2.54 and A2.55)	20-30	30	30
Coastal habitats			
Shifting coastal dunes (B1.3)	10 to 20	10	10
Coastal stable dune grasslands (grey dunes) (B1.4)	8 to 15	8	Acid dunes = 8 Calcareous dunes = 10
Coastal dune heaths (B1.5)	10 to 20	10	10
Moist to wet dune slacks (B1.8)	10 to 20	10	Low base availability = 10 High base availability = 15
Inland surface waters			
Softwater lakes (permanent oligotrophic waters) (C1.1)	3 to 10	Seek site specific advice	
Dune slack pools (permanent oligotrophic waters) (C1.16)	10 to 20	10	10

Permanent dystrophic lakes, ponds and pools (C1.4)	3 to 10		Seek site specific advice
Mire, bog and fen habitats			
Raised & blanket bogs (D1)	5 to 10	5	Apply guidance
Valley mires, poor fens and transition mires (D2)	10 to 15	10	10
Rich fens (D4.1)	15 to 30	15	15
Montane rich fens (D4.2)	15 to 25	15	15
Grasslands and tall forb habitats			
Sub-atlantic semi-dry calcareous grassland (E1.26)	15 to 25	15	15
Non-Mediterranean dry acid and neutral closed grassland (E1.7)	10 to 15	10	10
Inland dune pioneer grasslands (E1.94)			Acid dunes = 8
Inland dune siliceous grassland (E1.95)	8 to 15	8	Calcareous dunes = 10
Low and medium altitude hay meadows (E2.2)	20 to 30	20	20
Mountain hay meadows (E2.3)	10 to 20	10	10
Moist & wet oligotrophic grasslands:			
Molinia caerulea meadows (E3.51)	15 to 25	15	15
Heath (Juncus) meadows & humid (Nardus Stricta) swards (E3.52)	10 to 20	10	10
Moss & lichen dominated mountain summits (E4.2)	5 to 10	5	7
Alpine and subalpine acid grasslands (E4.3)			
Alpine and subalpine calcareous grasslands (E4.4)	5 to 10	5	5
Heathland, scrub & tundra			
Arctic, alpine and subalpine scrub habitats (F2)	5 to 15	5	5
Northern wet heaths (F4.11)			
Dry heaths (F4.2)	10 to 20	10	10
Forest habitats (general)			
Use if not one of specific forests in section below			
Broadleaved woodland (G1)	10 to 20	10	10
Coniferous woodland (G3)			
	5 to 15	5	10 (Use 5 if lichens/free-living algae important features of the site).
Forest habitats (specific)			
Fagus woodland (beech) (G1.6)	10 to 20	10	15
Acidophilous Quercus-dominated woodland (oak) (G1.8)	10 to 15	10	10

Meso- and eutrophic Quercus woodland (G1.A)	15 to 20	15	15
Pinus sylvestris woodland south of the taiga (G3.4)	5 to 15	5	12
Coniferous woodland (G3)	5 to 15	5	10 (Use 5 if lichens/free-living algae important features of the site).

3 AERMOD DISPERSION MODELLING DATA

The inputs for the dispersion modelling assessment are described in detail in this Section. A surface roughness factor of 0.2 has been used in the AERMOD modelling process, and the results in this report reflect the use of this factor. The site layout, including the nearest residential properties, is shown in Appendix A.

3.1 AERMOD Dispersion Modelling Package Description

The AMS.EPA Regulatory Model (AERMOD) is the current US EPA regulatory model used to predict pollutant concentrations from a wide range of sources that are present at typical industrial facilities.

The model accepts hourly meteorological data to define the conditions for plume rise, transport, diffusion and deposition. It estimates the concentration or deposition value for each source and receptor combination for each hour of input meteorology and calculates user-selected short term averages. The model also takes into account the local terrain surrounding the facility. Since most air quality standards are stipulated as averages or percentiles, AERMOD allows further analysis of the results for comparison purposes.

Percentile analysis for emissions is calculated for the maximum averages using the AERMOD-percent post-processing utility. This utility calculates the maximum concentration of a pollutant from all receptors at a specific percentile, for a specific period. Employing the percentile facilitates the omission of unusual short-term meteorological events that may cause elevated pollutant concentrations and hence a more accurate representation of the likely average pollutant concentrations over an averaging period.

The following information was input into the model for the prediction of maximum ground level ambient ammonia concentrations from the pig farm.

3.2 Input Parameters

The site layout map, building plans and elevations were used as a template for all sources, relevant structures and the boundary of the facility. The AERMOD package uses the steady state Gaussian plume equation for a continuous elevated point or line source. Tables 3 and 4 below gives general details of the pig houses.

Table 3: Dimensions of Pig Houses

	Dimensions	Total No. of Pigs	Efflux Temp	Emissions
FS1	88.4m x 22.8m x 6.5m	525 x Dry Sows	20 °C	Mechanically Ventilated
FS2	88.7m x 18.8m x 6.5m	225 x Farrowing	20 °C	Mechanically Ventilated
FS3	71.2m x 16.3m x 6.5m	225 x Farrowing	20 °C	Mechanically Ventilated
FS4	71.2m x 18m x 6.5m	525 x Dry Sows	20 °C	Mechanically Ventilated
FS5	36.9m x 15.1m x 6.5m	800 x Weaners	20 °C	Mechanically Ventilated
FS6	36.7m x 16.3m x 6.5m	900 x Weaners	20 °C	Mechanically Ventilated
FS7	41.2m x 18.7m x 6.5m	1,075 x Weaners	20 °C	Mechanically Ventilated
FS8	41.2m x 18.7m x 6.5m	1,075 x Weaners	20 °C	Mechanically Ventilated
FS9	44.6 x 41.5m x 6.5m	2,150 x Weaners	20 °C	Mechanically Ventilated

Table 4: Dimensions of Fattening Sheds

	Dimensions	Total No. of Pigs per Shed	Efflux Temp	Emissions
FS10	110m x 50.1m x 6.5m	2,600 x Growers 3,900 x Fatteners	20 °C	Mechanically Ventilated
FS11	110m x 35.1m x 6.5m	1,360 x Growers 2,040 x Fatteners	20 °C	Mechanically Ventilated
FS12	55m x 43.5m x 6.5m	840 x Growers 1,260 x Fatteners 410 x Maiden Gilts (incl. 10 x Boars)	20 °C	Mechanically Ventilated

It can be seen from the Tables above that sheds FS9 – FS12 include both fattener and grower pigs. A recent EU Commission Implementing Decision (CID)¹ defines production pigs, which will be housed on site, as,

‘typically reared from a live weight of 30 kg to slaughter or first service. This category includes growers, finishers and gilts that have not been serviced.’

This is evidence that production pigs also include grower pigs. Emission factors for grower pigs are provided in SCAIL and they are defined in BREF as ranging between 30-60kg².

It should be noted that not all animals on site will be at the maximum finishing weight prior to slaughter at the same time. When the sheds are fully stocked they operate on a continuous flow, rather than a batch type production system, thus at any one time there will be pigs in all the weight ranges the animals will range in weight between 30kg – market weight (c. 110-120 kg). It is expected that no more than 60% of the total animal numbers will be ‘fatteners’ (>60kg) at any time and therefore this assessment considers the worst case scenario of 60% fatteners and 40% growers.”

3.2.1 EARTH BERM

It has been confirmed that there is an earth berm located around all of the sheds on site.

This berm is 8m in height and provides a line of site barrier between all of the sheds on site and the nearest sensitive receptors to the site, specifically to the east.

A drawing showing the earth berm is included in Appendix A and it is represented in the AERMOD model by the inclusion of an 8m building surrounding the site. It should be noted that the natural berm and associated landscaping will offer some absorptive capacity which is not reflected in the AERMOD model given that it has been included as a solid building.

¹ Commission Implementing Decision (EU) 2017/302 of 15 February 2017 establishing best available techniques (BAT) conclusions, under Directive 2010/75/EU of the European Parliament and of the Council, for the intensive rearing of poultry or pigs.

² JRC Science for Policy Report. Best Available Techniques for the Intensive Rearing of Poultry and Pigs. Industrial Emissions Directive 2010/75/EU (Integrated Pollution Prevention and Control).

3.2.2 EMISSIONS

The rate of production of an emission, such as ammonia, is best quantified as an emission rate.

To find the emissions from the sheds, it was necessary to calculate the concentration within the buildings. The Section below details the emission rates from the sheds.

3.2.3 LOW PROTEIN DIET

It is accepted throughout the intensive agriculture industry, through robust scientific evidence, that a reduction in crude protein in animal feed, will lead to a reduction in ammonia emissions from livestock. There is also evidence to show that as ammonia from animals is decreased.

There are a number of recent scientific studies that have been carried out, and subsequent documents produced, in relation to the ammonia emissions from pig houses and the impact of mitigation measures associated with Best Available Techniques (BAT).

The recent EU CID³ states that one of the ways in which to reduce total nitrogen excreted, and consequently ammonia emissions, is to reduce the crude protein content of the pig feed.

This statement is supported by a peer review report which has been prepared by Hayes et al⁴, which cites Kay and Lee⁵:

'Reductions in ammonia emission equivalent to 9.8% per 10 g/kg reduction in dietary crude protein.'

Table 5 below summarises the level of reduction which are included in the conclusions of these reports applicable to this site:

Table 5: Effect of mitigation measures

Crude Protein in feed
Each 1% reduction in CP in the range 20-12% results in a 10% reduction in ammonia emission levels

It has been confirmed that the pigs on site will be fed a diet with a crude protein level of 16%. As a result, an ammonia reduction of 30% has been applied to the sheds on site.

3.2.4 REGULAR REMOVAL OF SLURRY

The emission factors for pigs have been outlined in Guidance published by the Environment Agency⁶, which is used to inform the emission factors detailed in the SCAL⁷ screening tool/ reference report.

There are various housing systems included in the document and the Table below details some the emission factors associated with the housing system on this site, which are compared to standard emissions for a Fully Slatted Floor (FSF).

³ Commission Implementing Decision (EU) 2017/302 of 15 February 2017 establishing best available techniques (BAT) conclusions, under Directive 2010/75/EU of the European Parliament and of the Council, for the intensive rearing of poultry or pigs. Pg 7

⁴ Hayes, E.T., Leek, A.B.G., Curran, T.P., Dodd, V.A., Carton, O.T., Beattie, V.E. and O'Doherty, J.V. (2004). The influence of diet crude protein level on odour and ammonia emissions from finishing pig houses. Bioresource Technology, 91: 309-315

⁵ Kay R.M., and Lee, P.A. (1997). Ammonia emissions from pig buildings and characteristics of slurry produced by pigs offered low crude protein diets. In: Voermans JAM, Monteny GJ. Editors. Ammonia and odour emission from animal production facilities. Wageningen, The Netherlands; CIGR pg 253 – 259

⁶ Pollution Inventory Reporting- Intensive Farming Guidance Note. Environment agency, January 2013, Version 5.

⁷ SCAL-Agriculture Update, Sniffer ER26: Final Report March 2014

Table 6: Source Ammonia Emission Factors for Regular Removal of Slurry

Category of Animal	Baseline Emissions for FSF (kg/yr/animal)	Housing Type	Source Levels (kg/yr/animal)	Reduction
Sows	3.01	Fully Slatted Floor (FSF) with vacuum system for frequent slurry removal	2.26	25%
Fatteners	4.14		3.11	25%
Weaners	0.29		0.22	25%

It can be seen from the Table above that the housing systems which accounts for the frequent removal of slurry (in line with the Best Available Techniques (BAT) Reference Document) results in a 25% reduction in ammonia emissions, when compared to the baseline emission factor for a fully slatted floor.

Section 4.2.3 of the EPA Guidance provides advice on mitigation offered by more than one mitigation technique, as is the case with this proposal. However, it is noted that this Guidance applies specifically to odour emissions. Within the Guidance it states,

'Until further scientific evidence is available to the contrary, where two mitigation techniques are operated on the same pig rearing installation, the applicant should be limited to:

- 100% of the odour reduction offered by the first mitigation technique; and
- no more than 50% of the odour reduction offered by the second mitigation technique'.

While there is no specific Guidance that states the full ammonia reduction associated mitigation cannot be used, a similar approach has been included in EPA responses to intensive agriculture applications. As a result, this assessment has applied similar reductions to the odour report (Rp002 2020191 dated 25 October 2022).

Given that the mitigation associated with the second technique (frequent removal of slurry) is 25%, only 50% of this has been applied, and the Table below takes account of an additional 12.5% reduction to account for the regular removal of slurry on site.

Table 7 below shows the category of animal and recommended emission factors per animal applicable to this project, based on the regular removal of slurry (12.5% reduction) and a feed crude protein content of 16% (30% reduction).

Table 7: Ammonia Emission Factors Taking Account of Mitigation

Category of Animal	Mitigation	Baseline Ammonia Emissions (kg/yr/animal)	Total Reduction	Levels after Reductions (kg/yr/animal)
Dry Sows	16% Crude Protein Diet & Fully Slatted Floor (FSF) with vacuum system for frequent slurry removal.	3.01	42.5%	1.73
Growers		1.59		0.91
Fatteners/ Maiden Gilts	4.14	2.38		
Farrowing Sows	5.84	3.36		
Weaners*		0.29	25%	0.22

*The full 25% reduction is applied to weaners for the regular removal of slurry, where no reduction has been applied for the incorporation of a low protein diet.

Table 8 below details the total emission rates per shed, based on the emission factors calculated above. The total emission rates are set as the pollutant leaving the building each second.

Table 8: Concentrations per Building

House No.	Animal Type (and Number)	Ammonia Emission Factor (kg/yr per animal)	Ammonia Emission Rate (kg/yr per animal type)	Ammonia Emission Rate (kg/yr per house)	Ammonia Emission Rate (g/s per house)
FS1	525 x Dry Sows	1.73	908.6	908.6	0.029
FS2	225 x Farrowing	3.36	755.6	755.6	0.024
FS3	225 x Farrowing	3.36	755.6	755.6	0.024
FS4	525 x Dry Sows	1.73	908.6	908.6	0.029
FS5	800 x Weaners	0.22	174	174	0.0055
FS6	900 x Weaners	0.22	195.8	195.8	0.006
FS7	1,075 x Weaners	0.22	233.8	233.8	0.007
FS8	1,075 x Weaners	0.22	233.8	233.8	0.007
FS9	2,150 x Weaners	0.22	467.6	467.6	0.015
FS10	2,600 x Growers	0.91	2,377.1	11,661	0.370
	3,900 x Fatteners	2.38	9,284		
FS11	1,360 x Growers	0.91	1,243.4	6,099.6	0.193
	2,040 x Fatteners	2.38	4,856.2		
FS12	840 x Growers	0.91	768	4,743.4	0.150
	1,670 x Fatteners (incl. 400 x Gilts & 10 x Boars)	2.38	3,975.4		

For the purposes of the modelling process, the emission rate per house was divided by the number of emissions points to obtain the emission value for each source. Table 9 below shows the emission rates coming out of emission point.

Table 9: Emission Rates for each stack

House No.	No of Fans (and type)	Ammonia per fan (g/s)
FS1	3 x BD-FF063 6DT	0.0043
	3 x BD-FF063 Zit (S)	0.0053
FS2	12 x Skov DA600	0.002
FS3	4 x BD-FF063 6DT	0.0027
	4 x BD-FF063 Zit (S)	0.0033
FS4	3 x BD-FF063 6DT	0.0043
	3 x BD-FF063 Zit (S)	0.0053
FS5	3 X Skov DA600	0.0018
FS6	3 x BD-FF063 6DT	0.0009
	3 x BD-FF063 Zit (S)	0.0012
FS7	6 X Skov DA600	0.0012
FS8	6 X Skov DA600	0.0012
FS9	14 x BD-FF063 Zit (S)	0.0011
FS10	24 x BD-FF091	0.0154
FS11	16 x BD-FF091	0.0121
FS12	12 x BD-FF091	0.0125

3.2.5 STACK EMISSIONS VELOCITY

There are four types of fan on the site, Table 10 below shows the ventilation rates for the chosen fan types.

Table 10: Ventilation Rates for fan

Fan Type	Stack Diameter (m)	Cross Sectional Area (m ²)	Exit Velocity (m/s)	Volume Flow (m ³ /s)	Volume Flow (m ³ /hr)
BD-FF063 6DT	0.63	0.312	10.87	3.39	12,200
BD-FF091	0.91	0.651	9.82	6.39	23,000
Skov DA600	0.6	0.283	11.98	3.39	12,200
BD-FF063 Zit (S)	0.63	0.312	13.63	4.25	15,300

*The technical specification of this fan is provided in Appendix C.

3.2.6 SLURRY STORAGE

Three covered slurry lagoons with rigid covers have also been included as part of this assessment. Table 11 below shows the ammonia emissions from the lagoons, taking into account the rigid covers.

Table 11: Concentrations per Building

Source Ref.	Details	Area (m ²)	Cover	Emission Factor (kg/m ² /yr)	Total Emissions (kg/yr)	Total Emissions (g/s)
FS13	Overground Slurry Tank	255	Rigid Cover	0.28	71.4	0.0023
FS14	Covered Slurry Tank	380	Rigid Cover	0.28	106.4	0.0034
FS15	Covered Slurry Tank	295	Rigid Cover	0.28	132.2	0.0042

The emissions above detail the total ammonia leaving each of the tanks each second.

3.3 Meteorological Data

For this assessment, five years' worth of meteorological data (2016 – 2020) has been derived from the three-dimensional Weather Research and Forecasting (WRF) mesoscale model. The data has been generated from a nested domain area centered on the Shannon Airport meteorological site at a grid resolution of 4 km.

The annual wind speed at the site was estimated as 6m/s, as shown on the MET Eireann website⁸. Using a ratio of 0.9 – 1.1, the preferable wind speed for the meteorological site is 5.4m/s – 6.6m/s. It can also be seen from the Figure that the average wind speed at Shannon Airport is approx. 5.5m/s, which is within the preferred range of wind speeds for the site.

Given that the average wind speed at Shannon is similar to that at the source location, and also taking into account that both locations are within approx. 10km of the coast, it was deemed representative of the average wind in the vicinity of the site. This allowed for the determination of the predicted overall average impact of emissions from the facility.

The corresponding meteorological datasets for the assessment have been acquired from Lakes Environmental who utilise the WRF model, a mesoscale numerical weather prediction system designed for both atmospheric research and operational forecasting applications to generate a representative, high resolution meteorological dataset suitable for use within AERMOD. The model is used globally to simulate weather conditions by drawing from observations and archived climatological model data and objective analysis to generate gridded meteorological parameters horizontally and vertically for a region.

Lake Environmental then employ the Mesoscale Model Interface Program (MMIF) to convert the prognostic WRF meteorological model output to AERMET pre-processor data input format prior to use within AERMOD.

Surface roughness of the files was updated and is confirmed as grassland, which is the dominant land type around the site.

The associated wind rose plots derived for each individual year are presented in Figure 1 below.

⁸ MET Eireann website available at: [Wind - Met Éireann - The Irish Meteorological Service](#)

Figure 1: Annual Windrose Data- Shannon Airport

3.4 Building Downwash

When one or more buildings in the vicinity of a point source interrupt wind flow, an area of turbulence known as a building wake is created. Pollutants emitted from a relatively low level can be caught in this turbulence, affecting their dispersion. This phenomenon is called building downwash. In order to conduct an analysis of downwash effects of the point sources created to mimic the release of odorous air from the pig farm, the dimensions (including heights) of the pig houses and other existing buildings on-site was obtained from drawings.

3.5 Digital Terrain Data

AERMOD contains a terrain data pre-processor called AERMAP. Receptor and source elevation data from AERMAP output is formatted for direct insertion into an AERMOD control file. The elevation data are used by AERMOD when calculating air pollutant concentrations.

Regulatory dispersion models applicable for simple to complex terrain situations require information about the surrounding terrain. With the assumption that terrain will affect air quality concentrations at individual receptors, AERMAP first determines the base elevation at each receptor and source. For complex terrain situations, AERMOD captures the essential physics of dispersion in complex terrain and therefore needs elevation data that convey the features of the surrounding terrain. In response to this need, AERMAP searches for the terrain height and location that has the greatest influence on dispersion for each individual receptor. This height is referred to as the hill height scale. Both the base elevation and hill height scale data are produced by AERMAP as a file or files which can be directly inserted into an AERMOD input control file.

4 AMMONIA

The ammonia levels were assessed in areas of specific interest in relation to vegetation.

All areas within approximately 7.5km of the site were searched on the EPA website for the four types of designated areas listed below:

- **Special Areas of Conservation (SAC)**

These areas are given special protection under the European Union's Habitats Directive to protect some of the most seriously threatened habitats and species across Europe.

- **Special Protection Areas (SPA)**

Areas designated under the European Commission on the conservation of wild birds (the Birds Directive). All EU member states are required to identify internationally important areas for breeding, over-wintering and migrating birds and designate them as SPA's.

- **Natural Heritage Area (NHA)**

This is an area considered important for the habitats present or which holds species of plants and animals whose habitat needs protection.

- **Proposed Natural Heritage Area (pNHAs)**

These proposed sites are of significance for wildlife and habitats. The pNHAs cover approximately 65,000ha and designation will proceed on a phased basis over the coming years.

There were eight designated sites located within 15km of the pig sheds which are shown in Table 12 below.

Table 12: Designated areas in vicinity of the site

Location	Description	Approx. distance to shed (km)	ING Grid Co-ordinates	
1	Ballymacoda Bay SPA	7.89	204677	73692
2	Ballymacoda (Clonpriest and Pillmore) SAC	8.02	204418	72809
3	Ballycotton Bay SPA	9.44	200203	67549
4	Great Island Channel SAC	9.94	188538	71890
5	Cork Harbour SPA	9.96	188510	71890
6	Blackwater River (Cork/Waterford) SAC	10.72	207412	80146
7	Blackwater Estuary SPA	10.79	207488	80164
8	Blackwater River (Cork/Waterford) SAC (Oak Woodland Habitat)	11.8	208358	81224

Ammonia modelling was carried out for each individual year with the results at the nearest identified locations presented in Table 13 below. All results are the Ammonia concentration in $\mu\text{g}/\text{m}^3$.

Table 13: Annual Average Ammonia Concentrations at Identified locations

Location	2015	2016	2017	2018	2019	Average
1	0.016	0.019	0.017	0.017	0.018	0.017
2	0.017	0.017	0.018	0.015	0.017	0.017
3	0.014	0.015	0.015	0.015	0.014	0.014
4	0.014	0.008	0.012	0.011	0.012	0.011
5	0.014	0.008	0.012	0.011	0.012	0.011
6	0.014	0.018	0.015	0.009	0.014	0.014
7	0.014	0.017	0.014	0.009	0.014	0.014
8	0.010	0.013	0.011	0.009	0.010	0.011

All of the predicted Ground Level Concentrations of ammonia detailed in the Tables above are significantly below the limit values as provided in Table 1 in relation to the protection of vegetation.

4.1 Results

Table 14 below compares the highest annual average predicted levels at the designated areas where:

- The Process contribution (PC), the maximum modelled concentration of the substance due to process emissions alone.
- Predicted Environmental Concentration (PEC) – that is, the maximum modelled concentration (of ammonia) due to process emissions combined with estimated baseline concentrations.
- PC and PEC as a percentage of the objective or guideline.

For the assessment of annual mean concentrations, the annual mean contribution of the process can be added to the annual mean estimate for background.

Table 14: Ammonia concentration at EPA designated ecologically sensitive location from pig sheds

	Location	Guideline ($\mu\text{g}/\text{m}^3$)	Background ($\mu\text{g}/\text{m}^3$)	Highest PC ($\mu\text{g}/\text{m}^3$)	PEC ($\mu\text{g}/\text{m}^3$)	PC/ Guideline level (%)	PEC/ Guideline level (%)
1	Ballymacoda Bay SPA	3	1.98	0.019	1.999	0.6	67
2	Ballymacoda (Clonpriest and Pillmore) SAC	3	1.88	0.018	1.898	0.6	63
3	Ballycotton Bay SPA	3	1.88	0.015	1.895	0.5	63
4	Great Island Channel SAC	3	2.40	0.014	2.414	0.5	80
5	Cork Harbour SPA	3	2.40	0.014	2.414	0.5	80
6	Blackwater River (Cork/Waterford) SAC	3	2.29	0.018	2.308	0.6	77
7	Blackwater Estuary SPA	3	2.29	0.017	2.307	0.6	77
8	Blackwater River (Oak Woodland Habitat)	1	2.29	0.013	2.303	1.3	230

The ammonia concentrations at the sites are dominated by the background concentrations, which are approximately 63– 230% of the air quality guideline for ammonia.

It can also be seen from the Table above that the guideline level (critical level) of ammonia is not exceeded at 7 of the 8 sites (Locations 1– 7).

At the one site where the Critical Level of ammonia is exceeded (Location 8), the PC of the site is 2% of the Guideline level, and as a result considered insignificant for the purposes of this assessment.

5 NITROGEN DEPOSITION

The Critical Load specifies the annual amount of ammonia that can be deposited for a given area per year. Below this level, sensitive habitat should not be affected.

The dry deposition flux ($\mu\text{g}/\text{m}^2/\text{s}$ of ammonia) was calculated using AQTAG06⁹ where the predicted ground level of ammonia (in $\mu\text{g}/\text{m}^3$) was multiplied by the relevant deposition velocity.

The dry deposition was then multiplied by the conversion factor provided in the guidance to convert to the levels of $\text{kgN}/\text{ha}/\text{yr}$. The conversion factors are provided in Table 8.1 and 8.2 of the AQTAG06 as presented in the Table 15 below.

Table 15: Conversion Factors

Pollutant	NH ₃ Deposition Velocity (m/s)	Conversion Factor
NH ₃ to N	0.02 (short vegetation)	260

Table 16 below converts the highest Process Contribution in $\mu\text{g}/\text{m}^3$ to $\text{kg.N}/\text{ha}/\text{yr}$, using the conversion factors detailed in Table 16 above.

Table 16: Conversion of Highest NH₃ Results

Location	Pollutant	Highest PC ($\mu\text{g}/\text{m}^3$)	NH ₃ Deposition Velocity (m/s)	Conversion Factor	Highest PC ($\text{kg.N}/\text{ha}/\text{yr}$)
1		0.019			0.10
2		0.018			0.09
3		0.015			0.08
4	NH ₃ to N	0.014	0.02 (short vegetation)	260	0.07
5		0.014			0.07
6		0.018			0.09
7		0.017			0.09
8		0.013			0.07

Using similar methodology to the ammonia assessment in Section 4 above the PC and PEC can be seen in Table 17 below.

⁹ Technical Guidance on Detailed Modelling Approach for an Appropriate Assessment for Emissions to Air, AQTAG06

Table 17: Nitrogen concentration at designated ecologically sensitive locations

	Location	Guideline (kg N/ha/yr)	Background (kg N/ha/yr)	Highest PC (kg.N/ha/yr)	PEC (kg N/ha/yr)	PC/ Guideline level (%)	PEC/ Guideline level (%)
1	Ballymacoda Bay SPA	20	5.66	0.10	5.76	0.49	29
2	Ballymacoda (Clonpriest and Pillmore) SAC	20	5.56	0.09	5.65	0.47	28
3	Ballycotton Bay SPA	20	5.56	0.08	5.64	0.39	28
4	Great Island Channel SAC	20	5.86	0.07	5.93	0.36	30
5	Cork Harbour SPA	20	5.86	0.07	5.93	0.36	30
6	Blackwater River SAC	20	6.95	0.09	7.04	0.47	35
7	Blackwater Estuary SPA	20	6.49	0.09	6.58	0.44	33
8	Blackwater River (Oak Woodland) SAC	5	6.95	0.07	7.02	1.35	140

It can be seen from Table 17 that the nitrogen concentrations at the sites are dominated by the background concentrations.

The PC at all Locations is less than 0.1kg.N/ha/yr, and as a result would be considered deminimus for the purposes of the Nitrogen assessment.

6 CUMULATIVE ASSESSMENT

Within the EPA Guidance, specific information is provided in relation to the consideration of Cumulative Impact Assessments. Section 3.2 notes that,

'As a first step the applicant/licensee should confirm the background ammonia concentrations and nitrogen deposition levels at the sensitive receptor and indicate whether there is already an exceedance of the ammonia critical level or nitrogen critical load.'

Where background levels are already exceeded at sensitive receptors, detailed modelling of emissions, including in-combination effects, a Natura Impact Statement (NIS) and additional mitigation measures are likely to be required. This is dependent on the sensitivity of the habitat at the Natura impacted area'.

Annex 1 of the document shows a flowchart for undertaking a cumulative impact assessment of a nearby industrial installation, which is shown below:

Figure 2: Flowchart for undertaking a Cumulative Assessment of a nearby Industrial Installation.

Annex 1: Flow Chart

The following points detail whether or not a cumulative assessment is necessary as part of this assessment.

- It is noted that Step 1 of the flowchart states “Are the background levels already exceeded for the ammonia critical level or nitrogen critical load at Natura sites within the zone of influence? (Go to step 4).

It can be seen from Tables 14 and 17 above that the backgrounds are exceeded at one of the designated sites (Location 8), and therefore the assessment continues to Step 4:

- ‘Following detailed modelling and a NIS, is the process contribution (PC) $\leq 1\%$ of the critical level for ammonia and $\leq 1\%$ of the critical load for nitrogen deposition?’

This threshold is exceeded at Location 8 for both ammonia and nitrogen, which will therefore require a cumulative/ in-combination assessment, taking into account IAI which meet the following criteria:

- All below threshold installations within 5km of the Natura site.
- All licensed installations within 10km of the Natura site.

In order to carry out a cumulative assessment it was necessary to identify any nearby installations that also have the potential to contribute a significant ammonia impact. There was one such site in the vicinity of the Natura site:

- P0651-01: Granted in 2004 and operating prior to 2018.

Given that the site in the vicinity was operational prior to 2018, the impact will be included in the background level of nitrogen and ammonia, and the approval of the associated licence will not impact on the existing ammonia levels or nitrogen critical load in the vicinity.

There are also no known newly constructed intensive agricultural sites completed within the last 10 years that are in proximity to the current site, or any section of the Natura 2000 site.

As there are no other nearby installations with the potential to contribute a significant impact at the River Blackwater SAC, no further assessment is required, in line with Step 4 of the flowchart shown in Figure 2 above.

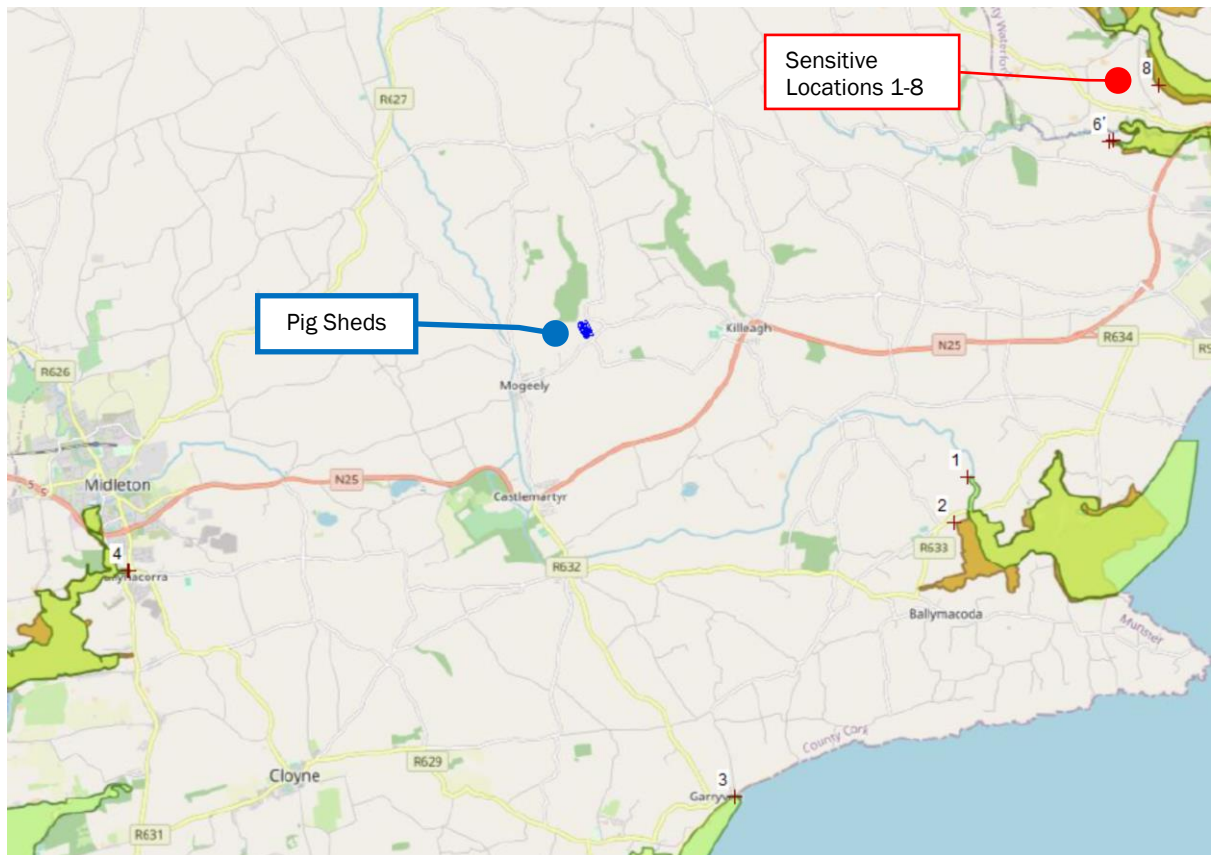

7 CONCLUSIONS

An air quality impact assessment has been undertaken for an existing pig farm at Mogeely, Co. Cork.

The predicted results of the ammonia modelling process show that the limits for the protection of vegetation are not exceeded at the designated habitats within the vicinity of the pig farm. Thus, any areas of ecological interest will not be adversely affected from the ammonia emissions for the operation of the farm.

Appendix D indicates the predicted dispersion of the ammonia plume for 2019 at the site.

APPENDIX A SITE LAYOUT

****Note- The above diagram is not to scale and is for illustrative purposes only. Exact co-ordinates are given in Table 12 above.**

The Figure below shows the 8m high earth berm around the pig site.

APPENDIX B SOURCE AND RECEPTOR LOCATIONS

The information below details the AERMOD model inputs, specifically in relation to source locations, building inputs and grid receptor inputs.

It can be seen from the Figures above that the building locations input in the model reflect a rotation angle of approximately 19 degrees.

It should be noted that the slurry tanks included in the assessment to the south of the site do not appear on the preview tab in each of the Figures above, but they are included in the AERMOD model.

APPENDIX D MODELLING RESULTS

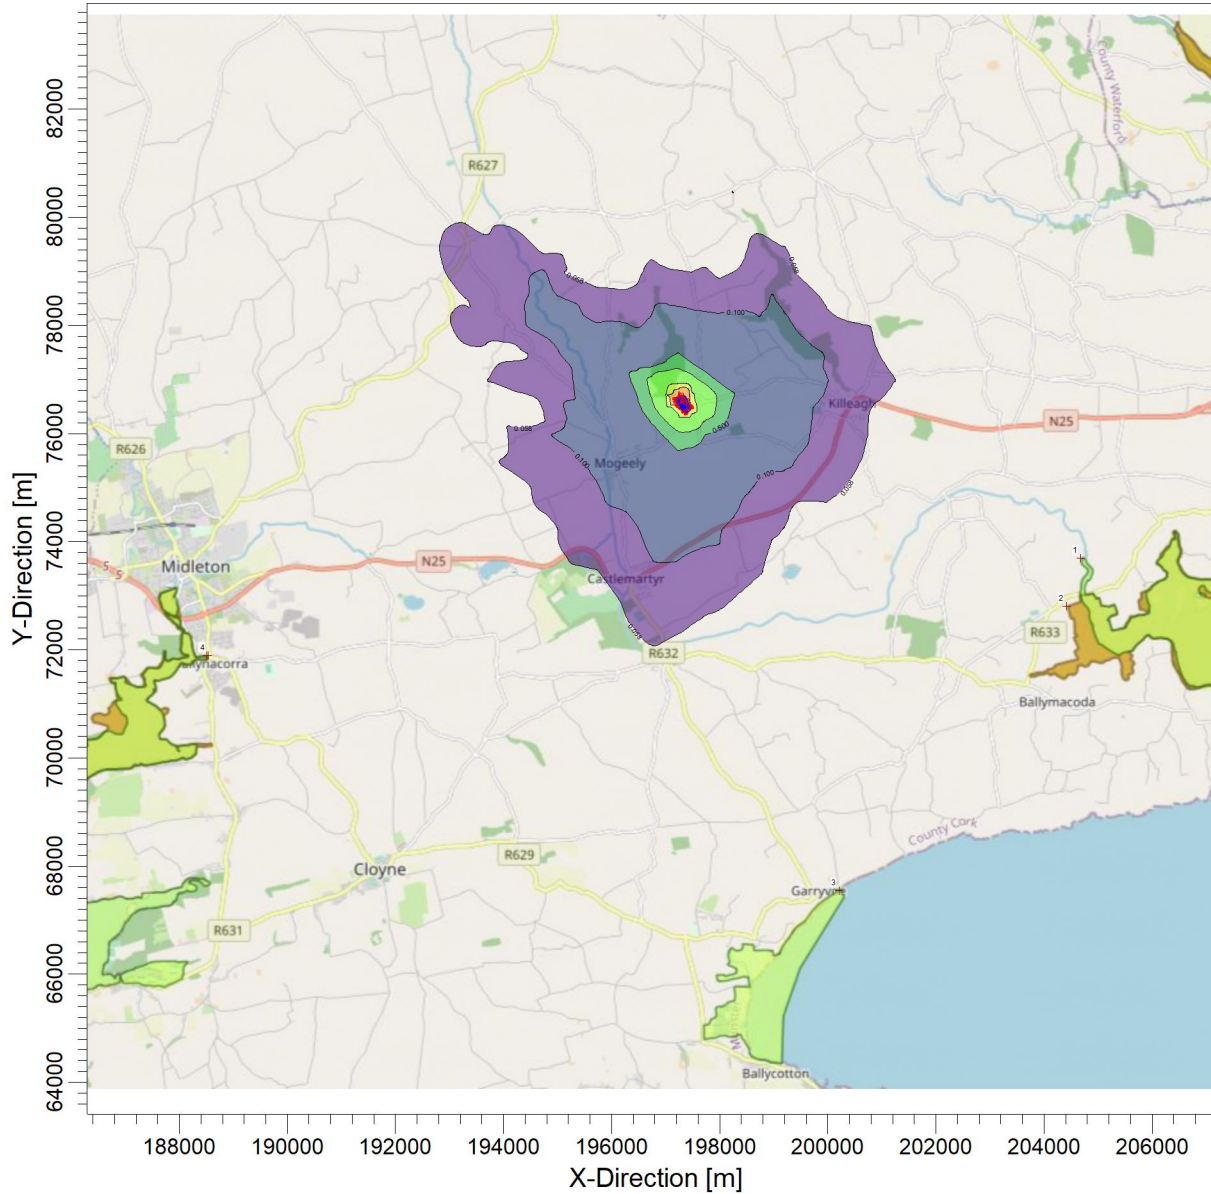

The Figure below details the predicted impact of the sheds based on Section 3.2 of this report.

It should be noted that the outermost contour ($0.058\mu\text{g}/\text{m}^3$) corresponds to a nitrogen deposition of $0.3\text{kg.N}/\text{ha}/\text{yr}$, which is considered de minimus for the purposes of a Nitrogen assessment.
